Not quite true. Here in Oregon, Denny Smith was defeated, after the
population became disgusted enough with his antics. This November, he
is running for Governor of our State. It is too bad that he is running
against an incumbent idiot who thinks that, since we voted through a
property tax limitation, that it means we want a sales tax - totally
ignoring the one that went down in the last year or two by a three to
one margin. Talk about a one track mind. Smith just might win, and
I don't know which of the two would be worse.

: It specifies non-public encoded transmissions. There's a difference between
: digital encoding and encryption. Any encrypted signal must be NSA approved
: (perhaps not directly but the NSA does dictate encryption standards; they
: will not endorse/allow any encryption that they cannot easily decode). Any
: encryption deemed public will be decryptable but what's the point? If the
: law enforcement agencies adopt encryption key management techniques it will
: be nearly impossible to follow the 'code of the day' without the ultimate
: in suoer computers.

As far as I know, encryption is not controlled by any government agency.
There are those that wish they were - witness the attempts to foister the
Clipper chip off on business.

: We are far from enryption being adopted by the law enforcement agencies.
: They couldn't handle the logistics involved in key management.

Actually, key management is trivial now - given the ability to now set the
encryption over the air - which would, of course, require that the radio
already be programmed with the previous encryption key.

: Digital encoding is the wave of the future and the future scanners will
: easily incorporate the decoders.

I hope so.

You might, but it is still in common use. I use it frequently
when I fly aircraft.

Also, SSB is a type of amplitude modulation - it is just that
the unneeded portions are discarded, before being transmitted.

: What distance can I expect a hand held scanner to be able to pick
: up radio signals above 30MHz with a) the telescopic antenna which came
: with it b)an external antenna slapped onto my chimmney stack?

There is no way to answer this question. It depends on the frequency, they time of day, the season of the year, the state of the sunspot cycle, weather conditions, the particular scanner/antenna combination, what other strong signals may be in the area and which frequencies they may be on, etc. For the external antenna, it would depend on the antenna, how high it is, anything that may be around that may block or reflect the signal, the manufacturer of the coax, the type of coax, the length of the coax. Also, electrical noise in the area will have an effect on reception - with both types of antennas.

4552. Recording 2006 audio with inex. vox recorder - How?

Newsgroup: rec.radio.scanner
Date: 1994-10-28 07:41:20 UTC
From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <Ba607oI.gregmason@delphi.com>
Source record: 266492

I've run into what is probably a simple problem. Perhaps someone who's solved
it can share the fix with me:

I thought that id program my scanner with Secret Service freqs, and monitor then
radio while I'm at work using my small cassete recorder. It's a realisitc,
with the vox feature (minisette 15). Id been able to do similar things with
the casette and my pro43. Anyhow, I connected the radio, via the tape-out
plug in the back, to my recorder. I used a short male rca to male 1/8 stereo
adapted to monoral with the apropriate adaptor. The moment I plugged it in
the tape began to run. When I turned the radio off, the tape quit rolling.
Pro46 same problem. Then I plugged it into
my pro43 when I lowered the volume the casette worked when there was audio
outyput, and turned itsself off when there was none. I went back to my 2006,
tried
turning the volume way down... nothing. Tried using the aux speaker plug...
nothing. Tried using the earphone plug in the front of the case... again,
no help.

Can anyone explain this phenomenon? Maybe offer a solution short of using
my Pro43, or getting a new casette?

Thanks,
---Greg

> scanners allowed on British Airways flights?

With regad to BA all I would suggest is ask one of the Cabin Staff when boarding to OK it with the Boss man in the driving seat. If he says No well its No.

Using your BC200XLT in the UK will not be a problem providing you don't wave it about too much in public. Owning a scanner in the UK is not illegal neither are their any restrictons on coverage but as a "man in the street" all you can legally listen to is Broadcast band Radio and Amateur Transmissions - anything else is technically a no no.

Don't be silly and you won't have any problems. Looking at the number of radios you might see at a civil or military airfield in the UK you might wonder what I'm on about !

You might find with your Bearcat that one or two transmissions will be in the incorrect mode and increment step. The BC200XLT with default to FM in all bands except the aircraft band. A local frequency used by the Police 152.3375MHz, AM - its no great problem though so bring your scanner and enjoy your visit.

Greg,
I experienced the same problem running the tape-out port on my Pro-2006
to a vox cassette recorder. The recorder would start recording even when
there was no sound. However, I managed to get it to work using the front
headphone plug -> mic jack on the recorder -- *but* I didn't use a regular
1/8" to 1/8" miniplug cable to make the connection. This might be where our
experiences with this differ. I bought and am using a cable from Radio Shack
that has 1/8" plugs on each end, but it's also an attenuating cable. If you
go down and look for it, it's got red plastic on the ends/plugs with a
short length of black cable. Hopefully, this will get it to work for you too.
Good luck with it....

Terry

4558. Winter Park PD (FL) Freq?

Newsgroup: rec.radio.scanner
Date: 1994-10-28 11:25:36 UTC
From: sbradley@sgb.oau.org
Message-ID: <CyDrqq.L5n@sgb.oau.org>
Source record: 266376

As of this past Wednesday (yes, two days ago), the local Winter Park Police Department in Winter Park, Florida flew up to their new 800 mhz frequencies.

I do not know what the system is and I have one of the frequencies:

866.3375

It was located last night. They have not apparently thought it needed to licence the new system though, or they made the decision after the Police Call 1994 went to print. Considering how long it normally takes for any decision of this kind, I am surprised it is not listed, but the one active frequency search mode revealed is not even listed under the "by frequency" section!

If you have any clues or a better database, please advise!

Thank you.

I think you will find the AOR 1500 dissapearing from the US - it
may re-appear as the Trident TR-1500 without cellular frequencies
but I don't know.

> Next, is there some "trick" which will allow me to clear all the
> programmed channels on the AOR1500? It's pretty tedious if you
> decide to re-arrange everything and want to clear everything.

Do you have a AR1500 or a AR1500"E" ?

How do you tell ? - take the battery out - if you have a small
lead of two wires coming out from the radio with tape over a switch at the
end you have an "E".

The instruction will probably tell you how to re-set the CPU via
the keypad but you need to switch the "Switch" in the battery
compartment. If you don't have an "E" version and the lead isn't
there you need to fit one so you can re-set the CPU.

> Lastly, along the lines of the previous question, are there any
> undocumented key combos that I might be interested in?

Not that I know of I'm afraid.

4566. DT Bill Voting Records of the House/Senate(long)

Newsgroup: rec.radio.scanner
Date: 1994-10-28 15:14:44 UTC
From: crisp@netcom.com
Message-ID: <crispCyE2CK.n1M@netcom.com>
Source record: 266380
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.security.pgp,alt.radio.scanner

Here at long last is a list of the voting records of those Congress Critters
that are up in Washington snatching our liberties away daily.

Recall that the Digital Telephony Bill (DT) includes provisions
making it illegal to monitor cordless telephone calls, making it
illegal to possess a scanning receiver, and or hardware and software
used for gaining unauthorized access to telecommunications services
with the intent to commit fraud. (A very ambiguous wording that
probably means if you ahve a computer controlled scanner, you will
be accused of snatching ESNs from cellphones).

I post this as a public service, I prefer to not see any followups
to the radio groups, note the followups are directed to alt.test

------Let the truth begin-----

Duck of the Year:
Sen. Feinstein's (D-CA) actions during the Digital Telephony bill
played one tune to her constituents, and another in her voting
record. She consistently voted to support the bill. During this

time, hundreds of her constituents called asking her oppose it
and were told that she was "taking the matter under consideration".
She did *not* receive anywhere near the volume of calls asking
her to support it. She continued to vote in favor of the bill.

Because she ducked the issue so blatantly, we've instituted a
special award for her this year, the Rubber Duck. It's an
actual rubber duck, suitable for bath use (and yes, it floats)
that will be sent to her via US Mail.

Voters Telecomm Watch urges you to carefully consider the
Senator's positions (and the positions of her challenger)
before supporting her with either a campaign contribution or,
if you live in California, your vote.

DESCRIPTION OF VOTING RECORDS

These ratings are based entirely on votes and bill (co)sponsorships.

Key:
Voted/Events monitored:
Bill sponsorship and co-sponsorships
House Rules Committee marks HR3937 "open"; allowing
amendments (7/11/94)

Gutted by the House Select Committee on Intelligence
(6/14/94)

CE+++: sponsored/authored/introduced legislation supporting
cryptography exports
(up 2 1/2 letter grades)
CE++: cosponsored cryptography exports legislation
(up 1 1/2 letter grade)
CE+: voted supportively on cryptography export legislation
(does not necessarily mean legislator supported the
legislation)
(up 1 letter grade)
CE-: voted against crypto export legislation
(down 1 letter grade)

Digital Telephony
==========

The Digital Telephony bills (HR 4922 and SB 2375), sponsored by
Sen. Patrick Leahy and Rep. Don Edwards, caused the most
controversy in the online community this year. Receiving
virtually no public attention outside the Internet community,
online organization split themselves on the bills, with the
Electronic Frontier Foundation (EFF) working with the bills'
sponsors to hack in privacy protections. The ramifications of
this decision are still being felt on Usenet, as many people
realize that the EFF cannot be all things to all people.

The Electronic Privacy Information Center (EPIC) chose instead
to oppose the bill and worked with the Voters Telecomm Watch
(VTW) to generate grass-roots support against the bill. The
American Civil Liberties Union (ACLU) also opposed the bill.

Votes/Events tracked:
Senate Judiciary Committee vote on SB 2375 (9/28/94)
Senators' "holds" on the bill

DT++: voted against the Digital Telephony legislation
(up 2 letter grades)
DT+: placed a hold on the bill (even if for a short time)
(up 1/2 letter grade)
DT-: voted in favor of the Digital Telephony legislation
(down 1 letter grade)

'**' Items
==========

A number of legislators acted in some noteworthy manner this session
(though not always honorable). Although we decided not to score
these with points, we went ahead and used a '**' to note the
action.

GRADES OF REPRESENTATIVES & SENATORS

All legislators were given a score of 'C' by default. Since nearly the entire House voted for the Digital Telephony bill, all Reps start out with a D. All Senators start out with a D as well, since having given "unanimous consent", they all virtually voted for the Digital Telephony bill as well. If your legislator doesn't appear on the list below, assume they received a 'D'.

QUESTIONNAIRE FOR LEGISLATORS AND THEIR CHALLENGERS
[Mail, call, or fax these questions to your legislator and they're
challengers, if up for re-election. This will help us map out the
current opinions of Congress. Mail their responses to vtw@vtw.org.

Note that if you're calling a legislator's staff member, you may have to
abbreviate the introductions to each question.]

1. The US Gov't. initiated control over the export of cryptography years
ago, before cryptographic technology became widely available outside
the United States. Now that it is available abroad, these export
controls hamper the US software industry's ability to compete
globally. This limited market results in fewer products with strong
privacy protections available domestically. Last year, Rep. Maria
Cantwell (D-WA) introduced a bill that would have corrected these
export controls to more accurately reflect the availability of
products abroad.

Did you support Rep. Cantwell's bill (HR 3627)? Do you support amending the cryptography export restrictions to better reflect the pervasive nature of this technology abroad and freeing American business from unrealistic regulation?

2. The Clipper Chip and the Tessera Card are part of the White House's new initiative called the EES (Escrowed Encryption Standard - Federal Information Processing Standard 185). This standard mandates law enforcement access to the communications of anyone using EES-based equipment.

These implementations were developed in secret with little public input but extensive public funds. The meager opportunity for public input resulted in 320 submitted comments nearly all of them opposed to the adoption of the standard. NIST chose to adopt the standard anyway.

All of the individuals who submitted comments opposing the standard expressed concern over the security, cost, and privacy exposures of the EES. Recently Dr. Matt Blaze, a scientist from Bell Labs, discovered a significant flaw in the Tessera Card that allows an individual to use the Tessera Card to encrypt information that law enforcement could not decode.

In the face of all of this failure, the White House, NIST and the NSA continue to pour funds into the EES project attempting to force a flawed and poorly defined standard onto a public and an industry that does not want it.

Do you agree that Congress should act to withhold funds on the EES (Escrowed Encryption Standard) and until the technical, privacy, and financial objections to the standard have been answered?

.

Has anybody remembered, that while other than items covered in Electronic
privacy act, it is NOT illegal to monitor conversations with a
scanner/ shortwave (whatever), but it IS a Federal Offence to divulge
what you have heard??

No Glenn it is not a "BIG SECRET" but If Morons like yourself continue to
point out to the everyday consumer of cellular / cordless etc.. it
will have to become a "covert" hobby!

And no it is not making us "better than" anybody. Everyday people not
involved in our hobby tend to react like most people do to what they dont
understand. They react with fear and outrage. You are not helping anybody by
making our hobby a public enemy. (I cannot believe I'm About to Say
This!!) If scanning were to become totally outlawed, there would still be a
"covert scanning hobby" just as there is with outband CBers. The people in
the general public would have no more privacy than before. Therefor all you
have done is Pissed Off Both Sides!!

So as I am so fond of saying, Use Some Common Sense!!

My guess is he will wait until after the November elections to sign it.
No sense in snatching any more liberties right before the elections, it
just makes the uphill battle his party faces that much tougher.

Listen to 850 MHz on a 400 Mhz Receiver

Copyright 1985, 1994, Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

An article[1] described the technique of using multiple injection frequencies, and introduced an equation which permits listening in the 512 - 657 MHz range (UHF television channels 21 through 44) using radios designed to receive 402 - 512 MHz.

This article introduces another equation, permitting 851 - 1158 MHz reception using a Radio Shack PRO30 scanner designed to receive 380 - 512 MHz. The equation may be applicable to other scanners.

Using this equation, my Radio Shack PRO30 scanner receives the Illinois State Police District 15 (855.4875) when the radio is programmed for 381.9250 MHz. Mr. James Cavanagh, of Palatine, Illinois, reports that his PRO30 receives the Palatine Police (856.7125 MHz) when programmed for 382.4500 MHz.

The Method

In the equations that follow, all frequencies are in units of Megahertz. To listen on a frequency Y between 851 and 1158 MHz, tune your radio to:

$$\frac{3(Y) + 10(IF)}{7}$$

where IF is the intermediate frequency of the receiver.

Conversely, if you hear a strange signal when your UHF radio is tuned to X MHz, you may be simultaneously listening to the frequency of:

$$\frac{7(X) - 10(IF)}{3}$$

When using this technique to receive microwave signals on a scanner, the signal may be very weak, because a typical scanner radio is not nearly as sensitive in the 851 - 1158 MHz range as it is on the frequencies for which it was designed.

Technical Explanation

What's happening is that an injection signal with multiple constituent frequencies is being being fed to the mixer stage.

To hear the Palatine Police signal (856.7125 MHz), the PRO30 is set to 382.45 MHz. At this setting, the local oscillator/tripler chain is injecting a signal into the mixer stage at:

382.450 - 10.7
= 371.750 MHz.

This 371.750 MHz signal is the output of a frequency tripler, whose input frequency is:

371.750 / 3
= 123.9167 MHz.

But, in addition to this 3rd harmonic, there is a 7th harmonic component present:

7 (123.9167)
= 867.4167 MHz,

which when mixed with the police signal on 856.7125 MHz, produces a 10.7 MHz IF:

867.4167 - 856.7125
= 10.7042 MHz

One may think of this 7th harmonic as being the sum of the 3rd harmonic, the signal the circuit was designed to produce, and the unexpected 4th harmonic, described in the previous article.

Poor Sensitivity

During reception of both police transmitters described above, the signal came directly into the mixer stage through the PRO30 case, bypassing the antenna and RF

amplifier stages! Tests were made using the supplied flexible antenna and an external 146 MHz antenna. The connection of either antenna made no difference in signal strength. Disconnecting the antenna altogether made no difference either. Apparently, the RF amplifier/antenna combination attenuated the microwave signals more than the plastic case, which is painted with a conductive substance.

Don't expect very good range on these frequencies. In both cases, the microwave transmitters were within a few blocks of the scanner and line of sight.

A Regency HX1000 scanner (IF of 21.6 MHz), was tested for microwave reception using this equation, but proved unsuccessful. Once again, readers are urged to experiment to find other frequencies to which their scanners may be receptive.

Hi,

Is there somebody who can tell me where I can find some scanner electronic kit (If it exists) ???

Here in france, I have read (in 'Electronique Radio Plan') an article on an electronic scanner (0 to 900Mhz, AM/FM Audio only) to build. But the problem is that I don't really understand this article.

Thanks in advance.

Sounds like your 7100 has an IF of 21.6 or 21.7 mhz which is picking up
2nd harmonics. Cellular is between 869 and 894 mhz base output.

I think there must be a better way to have the cordless phones
communicate with the base unit than is likely the case now employed.
Does anyone out there know what mechanism is used to link a particular
cordless phone to its base unit and prevent other similar units from
establishing a link with the base unit? Perhaps the method can be
discovered by a patent search???
Any useful reply would be greatly appreciated!

Here is the report card for the various perpetrators on Capitol Hill
regarding their voting on teh Digital Telephony Bill, which probably
outlaws or greatly restricts a number of activities we care about.
Again the followup is directed to alt.test. This is provided for information
purposes only. In keeping with net etiquette, I have noted the post
to be long to permit others to skip over it if not interested.

------Let the truth begin--------

October 24, 1994

PRIVACY GROUP RELEASES LEGISLATIVE REPORT CARD
FOR 1994 CONGRESS

For Immediate Release

NEW YORK - The Voters Telecomm Watch (VTW) an organization dedicated to
monitoring civil liberties in telecommunications, has just announced its
1993/1994 legislative report cards -- and the news isn't good. Almost the
entire Congress received a grade of 'D' for failing to recognize several
threats to American privacy that presented themselves to the legislature
this year, and one opportunity.

"A few legislators distinguished themselves, recognizing the bills that
threatened privacy this year, but on the whole, Congress was asleep at the
wheel," stated Alexis Rosen, VTW board member.

This year VTW monitored two pieces of legislation, Rep. Maria Cantwell's
(D-WA) cryptographic exports bill (HR 3627) and the FBI's Wiretap/Digital
Telephony bill (S.2375/HR.4922).

Representative Cantwell received VTW's Legislator of the Year Award for
her attempts to bring laws governing the export of encryption more in line
with the current state and availability of that technology overseas.

Rep. Cantwell's export bill would have made practical the incorporation
of encryption into systems and application programs. Currently, such
technology is not included because of government regulations
restricting the export of such software. Embedded encryption is
essential to expand business use of electronic mail and other
transmission of sensitive data, such as credit card information. It is
therefore necessary for on-line shopping and banking. Software
manufacturing currently one of America's strongest exporting industries
is threatened by foreign competition not subject to the same
constraints.

Representatives Melvin Watt (D-NC) and Elizabeth Furse (D-OR), both first-term legislators, received VTW's Rookie of the Year awards for their stated opposition to the Digital Wiretap bill, on privacy and fiscal grounds.

Most Congressional actions this year on telecommunications and privacy issues have been on voice votes, making it difficult to score individual performance. A network of hundreds of VTW volunteers have called and written their own legislators to ascertain their positions.

"Our legislators really don't seem to want to be held accountable," stated volunteer Josh Hendrix. "The breakfast food of the day is still waffles at Sen. Feinstein's office," stated a California volunteer, expressing his frustration after literally hundreds of faxes and called had been received by Senator Feinstein without a change in her position.

Senator Feinstein received a special award this year from VTW -- the 'Duck of the Year'. "She received hundreds of constituent calls and faxes asking her to oppose the FBI Wiretap bill," said VTW Press contact Steven Cherry, "and she still voted for the bill, despite the wishes of the very people she was elected to represent. We've purchased a rubber duck for her, and it will arrive in the mail soon."

Voters Telecommunications Watch is hoping Rep. Cantwell's bill will be reintroduced in the 104th Congress. Perhaps the biggest issue of the next session will be the continued legality of strong private encryption without key escrow. FBI Director Louis Freeh has been quoted as saying that, according to cyberjournalist Brock Meeks, "if the Administration's Escrowed Encryption System, otherwise known as the Clipper Chip, failed to gain acceptance, giving way to private encryption technologies, he would have no choice but to press Congress to pass legislation that provided law enforcement access to all encrypted communications."

The Voters Telecomm Watch legislative report card can be found on the Internet in their gopher at gopher.panix.com. You can also send them email requesting a copy (or information about the organization) at vtw@vtw.org. Finally, you can request a copy until November 15th via US Mail by leaving a message in their voice mail at (718) 596-2851. You must leave your entire address (including zip code).

VTW's efforts to garner grass-roots opposition to the FBI Wiretap/Digital Telephony bill were reported upon by such publications as the New York Times and Wired magazine. It's legislative report card has also been distributed onto the Internet, where it will quickly reach hundreds of thousands of readers within the first week of distribution.

Concerned citizens can reach Voters Telecommunications Watch by writing to vtw@vtw.org or checking their gopher at gopher.panix.com.

This is a well-known weakness of the PRO-43 design. That is why it is
particularly unsuitable for rail fans. Try using a lower-gain antenna.

According to my anonymous source, the PRO-43/43a is now history.

Sadly, millions feel as your friend does--that the US gov't is "okay", on
their side, "good". It's not, because no gov't is. The gov't looks after
its own interests and the interests of those who can afford access, period.

It's best to have the US government as small as possible. Protecting the
borders and scraping pigeon droppings off statues would be enough.

It's not practical, because to do so accurately would require that all radio
rcvrs use the same injection / IF frequecies etc..(they Don't). But yes, with
the right equipment, it is qutie possible to sit outside someone's home / car
whatever, and figure out what they are watching on TV, Radio, and even what
they are typing on the computer (NO JOKE!). Does it really happen? Probably
not unless you have some problem with the Feds!.

>Thanks in advance!

>Eric
>.

Trunking is the grouping of usually at least 3 repeaters together under one
control unit. The idea being that out say 3 channels (more typically 5 to 20
channels) there would always be a free channel avalable to use on a first
come first serve basis. For example if you had 5 conventional (non trunked)
repeaters with 50 users each, you would probably find one or more of them
doing nothing while the rest are busy with traffic. Since all the users have
to share the repeater, somebody on the busy ones is going to have to wait to
talk. In the mean time there is another reapeater that is not doing anything.
If you group the 5 together as a unit under a trunking controller. channels
are assigned as people need them. Therefor, in the above senario the guy who
was waiting his turn on the conventional repeater, now gets to talk because
that previously unused repeater is assigned to him. The only time somebody
would have to wait to talk, is if all channels in the system had a
conversation going.
Different manfacture's use different ways of assigning channels to the users,
but the basic concept is the same.

Side Note:
The FCC requires any user with more than 5 frequencies to trunk them. There
are other loading requirements that must also be met in order to keep the
frequencies.

Hope This helps :)

Here's a good thing for all you non-technical people. If you have a scnner
with the 868-896Mhz range blocked, you can still pick up cell freqs! Cellular
One does not use those freqs! Those are reserved for mostly Ma-Bell and
affiliates. For example, southwst bell, us west, etc... So just search the
areas around the blocked freqs and you should be good to go!

The Base transmit/Mobile receive frequencies are: 869.040 - 893.970 MHz
and this is further broken down as follows (not exactly but roughly):

869-880 Non-wireline System A
880-894 Wireline System B

Also Base receive/Mobile transmit: 824.040 - 848.970 MHz

All US analog cellular will be found in that range. All local telephone
companies (ie Bell Atlantic, NYNEX, etc) use the Wireline frequencies
and companies like Cellular 1 will be found on the Non-wireline frequencies.

Anything outside the above ranges is probably an image.

Mark

>can hear, cause then the fun might go away.

I feel sorry for you if that's how you think. The scanner
listeners I know listen to scanners for the same reason they
listen to TV, shortwave radio, and AM/FM broadcast radio: to
be informed. I listen to police channels so I know if that
cop car that fire department action down the street might
endanger me. I listen to cop channels because I want to know
what's going on (and in one case, what they were saying about
me, since I was involved in a complaint against them at the
time), and (if it were legal) I'd listen to the cellular channels
because the cops locally use them to discuss things which
are too sensitive to discuss on the standard cop radios.

I use scanners to stay informed. If you use them to
satisfy prurient interests that's your business, but
don't assume everyone else does.

>
>Everyone is acting like it's a big secret... but its not.

Your comments on this subject are idiotic. This in itself
is not a crime, since everyone makes idiotic comments on
something, but you are compounding the problem by causing
legal action to be taken, which affects us all.

>must have stolen my number EG cloned my ESN.

It is illegal to clone a cellular phone. You can't have the same ESN in more
than one cellaur telephone. It is federal law and I am trying to find the
section to cite but I don't think its a FCC reg (at least not in part 22).
Under your service contract with the carrier you will likely find a clause
stating that the telephone number you were issued was for one phone only.
Cloning is the equivalant to duplicating the VIN number on yor car and putting
on a second car. It's a serial number and you are not supposed to change it.

The carriers are likely to start offering service allowing multiple phones if
the market really demands it. The problem is that now most people that want a
second phone don't think they should have to pay extra for it. They compare
it to adding an extension phone in there home. Twisted pair and cellular are
an apples and oranges comparison. The technology and the rules are different.
The cost of such a service would probably be nominal, like $10 a month but I
would be guessing on that. Not all carriers have the capability to do it.
And those that do have the capability still need to work out technical and
administrative details. But what they would does not involve cloning phones.

Don't know if this is *exactly* the right group for this, but...

Recently I saw an ad in the British "short wave" magazine for
a clock controlled by radio signals labelled "DCF77" and "MSF".
Can anyone tell me where the transmitters are located and at
what frequency they transmit? (Yes, I know they're European
and I wouldn't get them here in the U.S.)

WWV in Colorado also transmits signals that can be used in
radio-controlled clocks, but I've never seen one of these clocks
for sale very cheap, rather more like $300-$400. The British
clock was much cheaper, something like 30-40 pounds.

Now I'm also wondering whether any companies out there are working
on radio-controlled clocks that use the GPS satellite constellation
clock signals, and would these be prohibitively expensive also?

Thanks much,
Ed Lieser

(speaking of time, don't forget to change your clocks this weekend,
all you USA'ers)

4590. Pro-2021 for sale!

I have just bought an Pro-2035 so I a getting rid of my
Pro-2021 scanner

Description below:

Radio Shack Scanner: Pro 2021 $150 plus s/h

Realistic Pro-2021
VHF/UHF Direct Entry Programmable 200 Channel Scanner Radio

This programmable radio is in excellent condition, yes fully functional.

You'll have access to over 23,000 frequencies!

Features include:

o Ten 20-channel memory banks
o One 10-channel monitor bank for temporary storage and priority freqs
o Rapid transfer from Monitor to Permanent Memory
o Large multi-purpose LCD shows which channels and frequencies are being
scanned, monitored, programmed, as well as the status of the channel
and operation mode of the PRO-2021.
o Provides optional two-second delay to eliminate missed replies on
any channel.
o Holds memorized frequencies with internal 9-volt battery backup

o Covers 30-50 MHz (VHF Lo)
50-54 MHz (ham radio 6m)
108-136 MHz (aircraft)
138-144 MHz (government)
144-148 MHz (ham radio 2m)
148-174 MHz (VHF Hi)
380-450 MHz (ham radio and government)
450-470 MHz (UHF Lo)
470-512 MHz (UHF Hi)
o Built-in internal speaker
o External speaker jack
o BNC external antenna connector
o 120-volt AC operation with power cord
o 12-volt DC power jack for automobiles and RVs (negative ground)

Mobile mounting bracket can be purchased at your local Radio Shack store.

Includes owner's manual and telescopic antenna.

Price: $150 plus s/h

If interested just email to jamesb@clark.net or
you can call at (410)969-7676.
If not home just leave msg on machine and I will return your call.

: What distance can I expect a hand held scanner to be able to pick
: up radio signals above 30MHz with a) the telescopic antenna which came
: with it b)an external antenna slapped onto my chimmney stack?

Anything within line of sight of the antenna ought
to be picked up quite well. The reliable distance
is quite dependent on the topography--an antenna on
a hill works a lot better than one in a valley.

If you are patient or lucky, there are phenomena that
allow signals to be received over hundreds or even
thousands of miles.

It is also possible to pick up noise from the sun and
other non-terrestial sources (radio astronomy).

Better yet, use one of the many techniques to encode the data into the
low order bits of some other file. There's a mac program available for
FTP which will do this - damned if I remember the name or site. Stuff it
in simulated noise or garbage. It's been said before, but I'll repeat it
anyways - encrypted information resembles junk, and there's no better
place to hide it than in real junk.

Normally police will not give out tactical frequencies because then the bad guys can listen in and know what the cops are up to. I don't want to risk my life or that of anyone else because the tactical frequency was known and the people about to be busted were listening in on the conversation.

Of course, in my area the various tactical frequences ARE known. They're given the names of certain colors. Gray and White are car-to-car, Green is the basic station frequency (shared with other stations, usually), Yellow belongs to the county mounties, Red is the county-wide communications channel. Purple is used to run plates and driver's license checks when Green is busy, Orange North and Orange South are shared channels that can be allocated to any of a group of PDs.

Remember that the power output and range of both the tower and portables
are different. The nosiy cellphone signals could also be that you're
inbetween two different cell sites (instead of being too close to it.)
and you're picking up the echos of each others when they transmit on the
same frequencies.

This is my best (guess) answer. When I tune into cell freqs. in some
small town, it's really clear and easy. When I hit the metro areas
(Seattle, Bellevue) it's usually VERY crowded, and ALSO, Our wire-line
carrier has switched to TDMA (or was it CDMA. Forgot which one.) digital
instead of analog phones. Meaning that some calls that you pick up will
be just data signals. Hope this helps!

Bill I AGREE 100%. I have AOL (soon to cancel). They don't seem
to update their newsgroups very often. I would find recent posts
to this group every day when checking in from work. When I check
rec.radio.scanner from AOL (from home PC), all the posts are several
weeks old.

When I explained this to the AOL tech support guy his response
was "we have no control over the internet". [Yeah, right.. which
information superhighway are you guys on anyway... seems like
they're on a muddy dirt trail in their covered wagons while the rest
of us are on paved freeways in our Ferraris].

Flame off. Sorry for consuming the bandwidth.

Popular Communications magazine Nov. 1994 did a first look at it. I
called ACE Communications (800) 445-7717 and got a nice faxback document
on the Trident TR-2400. It looks really neat although the scanning speed
is a little slow. Have yet to see, let alone test one, yet.

Next time bring a drill aboard and a cable to extend your ducky antenna.
Once you're at cruising altitude, drill a hole through the fuselage next to
your seat, and slip your antenna outside for excellent reception. :)

Kyler Laird (laird@pasture.ecn.purdue.edu) wrote:

... general follow-up to this whole thread:

When the government/law enforcement etc. have the ability to readily snoop on un-witting citizens with impunity, it will attract *more* people why want to do it. Many of those in that position will feel that they are not subject to any law regarding privacy. They will rationalize their invasion on our lives by saying that the information wouldn't be admissible in court.

What this boils down to is that grubby little parasites posing as "authorities" will have free reign over our conversations. Once the equipment becomes common there will be no credible control on access to the equipment. There is no limit to the personal and financial damage that could be done by someone with unlimited access to data and voice information once aerial transmission becomes commonplace.

hughem@netcom.com

When the government is powerful enough to give us everything we want, it will also be powerful enough to take everything we have.

rs> because my friend's pro46 picked up some cell conversations at the
rs> same time. So my question is what am I doing wrong? Do I have to
rs> remove D11 completely? Please help!

Hi, Rich...
Yeah, I remember doing the mod. It's quite possible the microprocessor wasn't ready for your mod. <g> Pop the battery cover off. If you take the battery holder out, you will see a small, white, rectangular button. Now, slip the holder back in and with a small screwdriver and the unit powered up, press the button. This should reset the scanner and hopefully, you will start receiving signals in this range. You might want to also verify that you are still receiving signals in the 850 range, just to be sure.

cgwh@chevron.com (Curtis Wheeler) writes:

> (5) Any other portable device that the operator of the aircraft has
> determined will not cause interference with the navigation or communication
> systems of the aircraft on which it is to be used.

Certainly you may presume to read this paragraph as saying that the
airline is technically determining whether any particular device causes
interference. I would belive a lay-person (rshepard@interacces.com)
could believe this, but I'm sad that the poster, a private pilot, seems
to accept this interpretation.

Given that the pilot of any plane I'm flying is patently inappropriate
to determine whether any particular device will cause problems, save
having us operate said devices one at a time, this interpretation is
silly. The FCC is the governmental body that determines the
interference generated and assigns a particular FCC class (residential,
computational, experimental, etc.) to the device.

Robert's vitriol notwithstanding, I belive that this paragraph means to
be interepreted as giving the airline the discretion of banning certain
FCC classes. Unless you know of some place in the terminal where the
airline is putting probes on scanners, CD players, etc.

>It is amazing how many people think they are exempt from federal

It's not defective - all Pro-43s do that. Mine gets clobbered between
150-165 MHz. It's one of the few drawbacks of the unit (although I
haven't decided if receiving the city PD dispatch over NMSU PD's F1 is
a bug or a feature...). Maybe that new Pro-62 has it fixed (it's GRE,
isn't it?).

Why are you sad? He's right. Take a look at the construction of the entire section. The FAA starts by prohibiting ALL portable electronic devices, then says that the prohibition does not apply to 4 specific types of electronic devices. It then allows the aircraft operator to allow a fifth type of device under certain conditions, that is, that the operator is satisfied that the device will not cause interferance. Note the distinction between the pilot in command and the operating company in the next paragraph. The airline doesn't have to ban anything, the FAA already did. The rule just permits the airline to allow specific devices on their aircraft if they want and they are satisfied that there is no interferance. The airline can choose, as some have done, to not permit any additional devices.

I think you're kind of confused about what's being regulated and how the
rules of the game were established. Where is the free entriprise
amongst the cellular service providers?

The truth is that the cellular service providers demanded that the
government step in and help them to establish territories, monopolies
and other anti-competitive policies.

>.. Art

Typically, when you place the handset in the charger cradle,
the base and handset talk back and forth through the charger
connection and agree on some arbitrary random code. Later when
you remove the handset, the base refuses to talk to anything
that doesn't know the code.

To use another, similar handset, you'd have to place it in the
cradle to set a code. Of course, the first handset wouldn't
know it had changed, so it would stop working.

: too, to see if there was a mod out there to get rid of it.

Up until a couple of years ago, the OPP used to monitor Channel 9 on CB.
They don't any more. OPP radar cars also have radar detector detectors on
board. Radar detectors are illegal in Ontario and most Canadian
provinces. In Ontario, if you are found with one, it's subject to
immediate seizure...

I am interested in the information provided. I am not a Canadian citizen
and therefore feel that the majority of users to this area are of U.S.
origion and care to hear of discussions pertaining to "such radio politics"

If you really are that upset I suggest moving to rec.canada.scanner.snobs.

4636. FLYING WITH SCANNERS?

Newsgroup: rec.radio.scanner
Date: 1994-10-30 00:11:54 UTC
From: glenn.johnson@chrysalis.org
Message-ID: <9410300011.00A1E02@chrysalis.org>
Source record: 266453

NE>>>I took my 2m transceiver and two scanners to Denver last summer. Never
NE>>>had a problem carrying them on to the plane or using them on the plane. I
NE>>>flew Delta and Delta allows the use of <VHF scanners> by name in their Sky
NE>>>magazine. They only allow in-flight use, not during takeoff or landing.
NE>>>I didn't hear much, I was so excited to be on a plane for the first time
NE>>>in years that I didn't turn my scanner on much.

Well, please review the sky magazine more closely. The FAA regulates
the operations of devices, not the airline. If it claims receivers
as an accepted device, it is a misprint. All radios have an IF section
(basically a miniture transmitter) and in a wideband scanner it has
a very high probability of causing interference. They do allow tape
players and computers, but NOT radios. I travel quite a bit, and have
been asked to put away my radio (even though I was using the cassette
part) Even if it was allowed, the reception inside a metal plane
(which creates a faraday shield around you) is so poor, it's hardly
worth it. The shuttle astronauts during sarex flights have 1/4 wave
antennae stuck on the windows that face the Earth to make it work.
If you ever have the chance, go up with a private pilot and bring your
radio. Mount an antenna on the BOTTOM of the plane (mag mount won't
work) and at least a 25W rig. At 10,000' ASL, your radio range will
extend several states on vhf/uhf! For fun pull up a common repeater
frequency (like 146.94 -) and ID. You may hear as many as a dozen
ID's comeback - What a pileup! Impossable to work anyone but on
simplex, but fun! Enjoy, experiment and BE SAFE !!

: Virginia Tech Information Systems
I just installed a OS456 and noticed the same thing. I upgraded to the Scanstarpro version so I could save the active frequencies in a scanstar database. I haven't tried the signal level scan yet. One annoying thing was that the software supplied (ver 3.41) caused my PC to hang up. The current version 3.44 fixes that bug. I'm not very happy about forking over $80.0 and then having to download the latest software over long-distance lines to get it to work.

4638. Re: ENOUGH ALREADY!!!!!!

Newsgroup: rec.radio.scanner

Source record: 266440

Messages that describe proposed or current laws and other political
or legal events affecting the scanning hobby clearly belong here,
and I hope they will continue to show up. Even though such laws
are valid only in particular countries (or states or cities), they
are of interest to those who travel, and to those who just want to
know what's going on.

Purely political discussions and diatribes (such as arguments about
whether all incumbents should be turfed out on general principles, or
about whether Reagan or Clinton has fewer active neurons) don't belong
here. Neither do arguments about bicycle gearing (even if I carry a
scanner on my bike sometimes) or gardening (even if your neighbor who
is a fireman was mowing his lawn yesterday), and for the same reasons.
Not that people shouldn't talk about such things; but they should do
so in the newsgroups devoted to such topics.

Norman Wilson
US citizen living in Canada, which means I have to pay postage to vote,
but I do it anyway.

4639. The Radio Listening Spectrum

Newsgroup: rec.radio.scanner
Date: 1994-10-30 01:39:48 UTC
From: g9153402@huey.csun.edu
Message-ID: <38uth4$sjp@nic-nac.CSU.net>
Source record: 266439

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally important. You'll find most transmissions are broadcasted in Narrow-band FM. Some main exceptions are shortwave (AM & SSB), commercial AM radio (AM), commercial FM radio (Wideband FM), television (Wideband FM), citizens band radio (AM & SSB), aeronautical communications (mostly AM), and some military VHF/UHF (Wideband FM). Most all scanners will pick a default mode for you, depending on what frequency band you are in. But many scanners also let you manually switch between modes (AM, FM, etc.) and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- --

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41

9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government,
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter.

But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

cgwh@chevron.com (Curtis Wheeler) writes:
: (a) Except as provided in paragraph (b) of this section, no person may
: operate, nor may any operator or pilot-in-command of an aircraft allow the
: operation of, any portable electronic device on any of the following U.S.
: registered civil aircraft:
: (1) Aircraft operated by a holder of an air carrier operating certificate
: or an operating certificate; or
: (2) Any other aircraft while it is operated under IFR.
:
: (b) Paragraph (a) of this section does not apply to -
: (1) Portable voice recorders
: (2) Hearing aids
: (3) Heart pacemakers
: (4) Electric shavers
: (5) Any other portable electronic device that the operator operator of the
: aircraft has determined will not cause interference with the navigation or
: communication system of the aircraft on which it is to be used.
:
: (c) In the case of an aircraft operated by a holder of an air carrier
: operating certificate or an operating certificate, the determination required
: by paragraph (b)(5) of this section shall be made by that operator of the
: aircraft on which the particular device is to be used. In the case of other
: aircraft, the determination may be made by the pilot-in-command or other
: operator of the aircraft.

: This section (specifically (c)) says the airline makes the determination to
: allow the use of particular electronic devices. The airline company is the
: aircraft operator/air carrier certificate holder in that case. A pilot in
: command that allows use of a device prohibited by the company would be in
: violation of this FAR.

That is not what the claim was. The claim was that there was a blanket
prohibition against allowing various electronic devices. As may be seen
from your posting, that is NOT the case.

Bill

: Are there any Canadians or Americans out there that have travelled across
: the border with their scanner and experienced any problems? As long as I
: have my original purchase receipt will I be O.K? Hope there's someone out
: there that can enlighten me.

You should take your radio down to your local Customs Office and get it registered (should be done with all electronic equipment, computers, camera, etc.). This is the documentation you will need to show (if requested) that your radio or whatever was purchased in Canada and you won't be charged duty/GST/whatever.

You could also carry your scanner in your hand luggage (if flying), as it could go "missing" in your luggage.

You should also find out what the regulations are for scanners in Illinois. Maybe they are legal and maybe they aren't...

I've taken my scanner into the U.S. but I had more fun with my short wave receiver <g>

Bop out to your local Coles or SmithBooks and pick up a Haruteq guide.
over 200 PIA frequencies listed there. Also check to Ontario DX Assn. BBS
at 905-841-6490. There may be a file with the PIA frequencies there...

4644. Radio Shack DX-392 Zap Question

Newsgroup: rec.radio.scanner
Date: 1994-10-30 02:32:40 UTC
From: g9153402@huey.csun.edu
Message-ID: <38v0k8$sjp@nic-nac.CSU.net>
Source record: 266442
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

I own a Radio Shack DX-392 shortwave radio (aka Sangean ATS-818CS).
I use an approximately 50 foot long, insulated, 18 gauge wire, running
from the radio, going around the floor/carpet of my bedroom (I'm on
the second floor) and then going into my closet where it stops at the
end of the top shelf. This set up works fairly well in getting most
shortwave reception. My concern now is possibly zapping the unit with
some static charge or signal overload which may somehow wreck it, or
hurt its sensitivity. Any suggestions on my fear here, and whether I
should attach any resistor to where my wire antenna is clipped to the
whip antenna, to protect the receiver's circuitry?

>glitwin@craysea.cray.com

These freqs are from the DODs IFR supplement (published by the Defense Mapping Agency). Mc Chord AFB: Tower 236.6, Weather 342.5, FAA Flight Service 255.4, Pilot to Dispatch 372.2, Command post 349.4, Seattle Approach 391.9. I hope these work for you. I used to fly C-141 aircraft into Mc Chord from Travis AFB, CA. Good luck.

>not unless you have some problem with the Feds!.
>

Hi There...

Probably not legally in the US, but it definitely happens in the UK
where I just spent a year. They have these little vans that drive up and
down the streets which use injection to detect TV sets (you pay a license
fee for having them). Doesn't even matter on the brand. Shows that it
can be done quite easily.

Actually you do care but you rdo not realize it. The US market for equipment is the largest in the world, many devices sold in the US are th same models sold elsewhere. In some cases what is legal to be sold in the US determines what you will be offered for sale.

Finally for good or worse, often other countries follow suit in having new laws as we do in the us. If we start banning this and that, then your politicians may clamor for the same restrictions.

How hypocritcal of you, Jeff. This is the same Jeff Herman who drones on endlessly about homosexual bathroom cruising and sex acts at his University on rec.radio.amateur.policy (almost to the point of making even the straightest readers wonder if Jeff had toilet-training problems as a child) while ignoring all reasonable pleas to exercise some constraint and appropriateness of venue regarding subjects that are clearly not radio-related.

As surely as death and taxes, Jeff can be counted on to take any thread regarding the Lambda Amateur Radio Club and twist it into something unrecognizable as an amateur-radio-related thread of discussion. However, God forbid if anyone annoys Jeff with off-topic articles that are not part of his obsessive personal agenda. You've helped turn the radio-related Usenet newsgroups into what they are today, Jeff (both the bad and the good), take some responsibility for your actions.

Of course, restraint and appropriateness of venue are binding on me as well, so I've spoken my peace on this issue and won't rant further (but I will at this time emphasize that I'm straight and am criticizing Jeff's immaturity more than his attacks on the homosexual lifestyle, which I consider more comical than "homophobic," whatever that is).

4655. Pro-43 direct frequency entry?

Newsgroup: rec.radio.scanner
Date: 1994-10-30 08:06:51 UTC
From: kwong@ee.ualberta.ca
Message-ID: <38vk6r$13ot@quartz.ucs.ualberta.ca>
Source record: 266454

I recently bought a Pro-43 handheld scanner to complement my Pro-2032 base station. For the most part, keypad operation is very similar. However,there is one feature from the Pro-2032 -- which I believe is not mentioned in the manual -- that I miss on the Pro-43.

On the Pro-2032, upward or downward scanning from a directly entered frequency (as opposed to a stored channel) is possible. With the radio in Manual mode, you simply punch in the frequency in megahertz and press the Up or Down button. The shortfall of the Pro-43 is that it can only do Direct scans from stored channels. So if you want to scan a new band, you either store the initial frequency as a channel first and enter Direct scan mode from there, or do a Limit search after setting an upper and lower frequency.

Did I miss something in the Pro-43 manual?

Message-ID: <CyHqvJ.FHu@cix.compulink.co.uk>
Source record: 266466

Thanks guys for all the comments on the Pro-43. My deciosn after a few days was to return it under my money back guarantee for a refund. Why?

Well to be honest, I was not happy having the gaps, silly maybe, but given money is not really a problem, I figured I may as well spend a bit more an get a full range unit.

I looked at the MVT 7100, but to be honest I was not very impressed, it seemed to have poorer "sound quality" than the pro-43, so I went all the way and got an AOR 8000.

This is very nice, and I particually like the dial facilty on the top which the pro43 lacked (although the MVT 7100 has it also). Only quibble is that for 420 ukp, (MVT 7100 was 320 ukp) the battery cover is very loose, although I guess when I have got the soft case this will not be a problem.

Next thing to sort out is a decent anttena for home use, I am a bit confused about this actually, esp as the 8000 goes up to 1900 odd Mhz and most "discone" only cover 1300.

Silly question time: If I have a discone (or what?) on my roof, can I (assuming plugs being correct) feed my normal FM tuner with it when not using it for the scanner?

Kevin

4659. Basic beginner

I think I have some info that will help you, but not a whole
lot. :-)
Balt. City FD dispatches on 154.145, I believe. Lower unit numbers
are downtown, higher numbers are outlying areas. (ie: E45, L27, M14 are in
deep, darkest Northwest Baltimore)
Balt. County dispatches on 46.46. Then they switch them off to one of
four operations freqs, which I can't remember. Sorry! Their setup is rather
odd. There is a paid Balt. County FD which operates single engine companies
and ALS medical dispersed throughout the county. There are also a vast number
of volunteer companies-somewhere near 50-that do most of the heavy work.
Here are a couple from memory.
Pikesville-32n
Owings Mills-31n
The vollie companies are assigned the first two digits of their unit numbers
on a countywide basis. They range from 10n on up to forty-something. The
paid units are just E1, M1, etc. etc. Have fun! Both freqs I gave you are
rather busy, and the city has trunking tones on their freq. Yuck!

Most police departments have the mobiles broadcast on one frequency while the base station broadcasts on another. The repeater is designed to pick up the mobile station's broadcast and rebroadcast it on the base station frequency. If you are getting only the base station, you may have a one-way system. The CHP has a generic "all cars" broadcast frequency that is used only to broadcast. The mobile frequency is not rebroadcast on that frequency.

Hello All! Looking for some help in purchasing a nice mobile antenna. I would like a permanently installed, inconspicious installed antenna. Like one of those "cellular" look a likes. Specifically for the CB receive bands, and the police bands. I just bought a new Trident TR2-C which covers those specific areas which I'm going to permanently mount under my dash.

My problem is, that some people say that the "Cellular" look-a-like scanner antennas are worth crap (the no-holes-need-to-drill-thru-glass type) and I'm not so sure about the performance for the 18" whip antennas.

Could somebody give me some ideas on what I should purchase for a nice "non-attention drawing" external antenna? Prices, and places to get. If all else fails, I'll probably end up going to the local Radio Shack and purchase the 18" whip or the cellular look-a-like.

Thanks in Advance!

<CyE9s4.84G@boi.hp.com>

I have a similar (identical?) problem when recording from my 2006
with a vox recorder.

I discovered that in my case, at least, some of the frequencies I
programmed to scan were in different bands. Specifically, I had
a 40 mhz band frequency programmed in with predominantly 150 mhz
band frequencies.

A very slight "pop" sound could be heard when the scanner dropped
down to the lower band. It's very faint, but enough to activate
the recorders vox circuit even when set on low sensitivity. My
"solution" was to lock out the offending band-changes when vox
recording. If anyone has a more elegant and workable solution
I'd sure like to hear it.

Atta boy, Tony!
This discussion sub covers just about anything pertaining to scanners.
That's the beauty of it.You can find (or ask about) whatever you want.
And if you don't like the topic on a thread, then don't read it. I
can't believe that you are saying it's more of a pain to skip over
a thread than to read it.
Dave

But Tony, I think even if the Americans WERE in the minority, we would
have as much right to post as the majority...regardless of the topic.

Dave

Is there a usenet guru out there who can explain exactly how to
start a reorganization of scanner-related newsgroups? Do we circulate
a petition? Is there a body that approves new discussion groups? To whom do
we address our views? Is there a voting process?

A number of writers in this newsgroup (myself included) have already
commented that the breadth of material, while all valid, has become
inconvenient. Some sort of subdivision would help the reader get to
specific topics quickly, and those who have the time and interest to
digest it all can still read all the newsgroups.

So, assuming there are others of like minds, how does one start things moving?

Regards, Paul

PS: While I'm on my soapbox, my personal opinion of what to do is:
Establish a new newsgroup limited to exchange of technical information -
eg VHF/UHF radio theory, transmission line and antenna theory,
monitoring techniques, information on how UHF/VHF systems work
and how they are used. Discussion of *NEW* equipment and modifications would
be acceptable, as would listing of *NEW* or topical frequencies....
but those seeking well-documented information on freq's, mod's
or 'old' equipment would be politely referred to FAQ's or FTP sites.
The existing alt. and rec. scanner groups would remain for far-reaching
discourse on other topics just as they are used now.

You might try the 450-470 Mhz band. The Taco Bell in my city uses a repeater in the 464/469 range. It is very low power, and the output on 464 is continuous. If it is like this, it should be easy to find if your scanner has the search feature. Also, this Taco Bell opened in the last 2 months.

Hope this helps!

Add to the above the United States Secret Service. They busted him over a month ago, got a federal grand jury to hand down two counts, and Harris has been sitting in jail as a federal prisoner for the past 5 or 6 weeks. No bond has ever been set, so he cannot get out, even if he had the money to post a bond.

As best I know, his book was mainly sold through radio stores in th e Fort Lauderdale, Florida area. It is "rumored" that other charges against him are waiting for him if/when he ever gets back on the streets.

>my Pro43, or getting a new casette?

I had the same problem with my 2006. The problem is the audio out is
line level. You can use the earphone jack in the front and crank the volume
down real low.

What I did was make a attenuator cable. This drops the level 90%.
Get a 10K and 1K resistor..

>Of course, what good it will do them (I mean the passing of a law, like we
>really care? Like we are actually going to obey it? <- NOT!). It's only

Compliance is not expected. The goal is to establish that it is immoral and unethical first. Public opinion is how you change things, so you must convince the public - you must set a legal expectation. You have to establish first that scanning is an unethical invasion of reasonable expectations of privacy.

The eventual goal, once the image of sort of a cross between a peeping tom and a hacker is established, then and only then can compliance be expected. Why should scanners be manufactured? Sure, some are used legitimately, but millions of people's privacy is being compromised by the unscrupulous majority of scanner owners. The needs of the many outweigh the needs of the few. Scanners when allowed to be sold are abused by peeping-tom-hackers. They should only be sold to those that can prove they will use them responsibly (e.g. law enforcement, etc.)

You really have to ask yourself if the government itself benefits from the availability of scanners. Once you honestly answer that question you should be able to figure out where they are headed. The government has acted and will continue to act to protect itself.

Deciding to ignore them is the worst thing you could do.

[...]
>calls? I OWN my airspace, and I shall monitor cordless, cellular, you name

4690. New version of PRO-2026(2026A)

Newsgroup: rec.radio.scanner
Date: 1994-10-31 05:30:49 UTC
From: henniger@crl.com
Message-ID: <391ve9$5ce@crl10.crl.com>
Source record: 266338

Just got my hands on a Radio Shack PRO-2026A to see what it was as was pleasantly surprised. The guys at RS have done a good job with bugfixes.

Differences I noticed were:

- Still Modifiable
- Fold down sitting stand for table top use (you can still hear the speaker)
- 12 volt connector with cable (so now you don't have to deal with the problem on the old 2026 of how do you disconnect from your car- you could disconnect the fuses holders but the ground was still there and not disconnectable. Now just get a 12 V supply, and bnc antenna for your house, and its a snap to unscrew the 2 side screws, and disconnect the two cables (power and antenna) and zip inside.
- 14 day non-volativity on the memory (remember the 2026 old version had two power connectors, one for memory and one for general power) they fixed this so you can really move it from car to house or car to car.

There are probably a bunch of stuff they fixed but these changes jumped out at me.

BTW, the radio shack down the street has a Manager's special for $150 (regular $229.)

Mick
(no, i don' work for them.)

PS - Could it be that the manager's special is a clearance to get them out of the way for the new mobile scanner? ($199 on display today) I don't know but I would guess that the microcode on the new mobile scanner has been modified (- to be unmodifiable that is.)

> While in the manual mode press PGM, enter the frequency of interest,
> press ENTER, press DIRECT, then use the up or down keys to scan from
> there. Is that what you had in mind?

When you punch in a frequency and press ENTER in Program mode on the Pro-43, that frequency is stored to whichever one of the 200 channels is currently selected. If you do this without checking the current channel, the stored frequency will be replaced by the one you just entered.

I wanted a way to enter a "preliminary" frequency from which to start a quick search for active frequencies. There is no need to keep the initial frequency. Lacking such a direct method for frequency access, I reserve channel 1 as a scratch memory. I make channel 1 the current channel, then program it for the initial frequency, and start a Direct (indirect?) search from there.

This is not a big complaint of mine. Jumping to new frequencies for a quick scan is just a little inconvenient.

Since when did roofers do eavesdropping and signalling work?

As the Nazis were taking over Europe, they were banning receivers under
penalty of death. (This didn't prevent some resourceful (and brave) people
from firing up the home-brew hidden in the coffee-tin though).
I sincerely didn't want to rub salt into old wounds, but I guess I've
got to come right out and say it to clarify my point...We can't count on
a super-power to bail US out. I didn't come right out and mention this
bit of sad history to the fellow in Europe. I didn't have to, based on
his latest reply.
By the way, my server automatically posts this to rec.shortwave (and
alt.scanner, rec.scanner) all at the same time, by no choice of my own.
Some of us do discuss stuff unrelated to shortwave and it ends up on the
shortwave forum inadvertently, although it *may* be relevant in this
case.
(I noticed some of the shortwave folks wondering what was going on).

Too bad for you, because many of the scanning radios you buy up there are built down here. Do you really think they'll make a version just for you, with forbidden chunks of radio spectrum intact?

Sorry to bust your bubble, but what goes on here very much affects you there.

> US
> determines what you will be offered for sale.

FYI, a friend of mine just purchased a *brand new* PRO-43 [as in new manufactured unit] from our local shack and it is NOT of the same type that you would be able to buy in this day and age. No A on the model, no A in the serial, diodes all over the place.

And I'm in Western Canada.

[Editorial comment: Not that I give a crap whether or not the scanner can be "cell-modified".. you people that listen to cellular must lead the most boring lives going.. and don't give me that junk about "I have a right to listen to it".. I bet you have a right to listen to the noise waves coming off the cables buried underneath your house too, but I don't see anyone clamoring to do so.. I purchased my scanner for three things: 1. Listening to my fire frequencies in the 413/418MHz range [yes, 'my'--I am a firefighter/medic]; 2. Listening to local police in 155-156 and 462-463 for entertainment and to ensure I stay out of trouble spots; 3. Listening to the other local ambulance service, on an 800MHz trunk, for entertainment. That's it. Oh, I might change my ways when we switch to an 800MHz trunk for fire sometime in 1996 or 1997, but hey, that still falls under topic 1, listening for fire. I don't have cell, or cordless, or McDriveThrus, or gas companies, or towtrucks, etc etc etc programmed in. The boredom quotient alone would kill me. This tirade brought to you by a guy tired of the whining about others not being able to listen to cell.]

> Finally for good or worse, often other countries follow suit in
> having
> new laws as we do in the us. If we start banning this and that, then
> your politicians may clamor for the same restrictions.

Don't plan on it. Right now you can listen to anything you want here in Canada, so long as you don't divulge or use it for your own gain. Though I wouldn't suggest parking beside an RCMP pursuit cruiser with your scanner up all the way and all the windows down unless you're on really good terms with the constables inside. :)

In short, get over yourself..

: When you punch in a frequency and press ENTER in Program mode on the Pro-43,
: that frequency is stored to whichever one of the 200 channels is currently
: selected. If you do this without checking the current channel, the stored
: frequency will be replaced by the one you just entered.

Ok, so why can't you just add one more step to the top instructions?
It'll work if you simply press PGM then _Limit_. Enter the frequency,
hit enter, and direct scan away. You don't need to enter a top range for
the limit.

I just tried it- it works fine.

I can't imagine it either, but MT this month lists Taco Bell freqs as 30.84, 154.57 and 465.8875

There is some other fast food freqs there, too. Why would anyone want to listen to a hamburger being ordered?

There is a bill in Congress that would outlaw any non-NSA accepted encryption standard. Yes, there are efforts to block the bill, but rest asssured that there will be a heck of a fight on the governments plot. They want it as bad as the security agencies. So far it's a good sell regardless of what one hears on the net or network news.

> cgwh@chevron.com (Curtis Wheeler) writes:
>> (5) Any other portable device that the operator of the aircraft has
>> determined will not cause interference with the navigation or communication
>> systems of the aircraft on which it is to be used.

>Certainly you may presume to read this paragraph as saying that the
>airline is technically determining whether any particular device causes
>interference. I would belive a lay-person (rshepard@interacces.com)
>could believe this, but I'm sad that the poster, a private pilot, seems
>to accept this interpretation.

Picking the section apart and trying to interpret one paragraph won't work here. You need to go back and read the ENTIRE section.

I don't interpret this as requiring the airline to make determinations on "technical" (electronic) grounds. But "technically" (legal), it's up to them.

>Given that the pilot of any plane I'm flying is patently inappropriate
>to determine whether any particular device will cause problems, save
>having us operate said devices one at a time, this interpretation is
>silly. The FCC is the governmental body that determines the
>interference generated and assigns a particular FCC class (residential,
>computational, experimental, etc.) to the device.

Despite your feelings of the PIC's "technical" knowledge, the FAA puts the decision in his/her hands under certain circumstances. The FAA gives the PIC a regulation to follow that requires a determination to be made. In the case of an airline operation, the airline company is to make the determination. If they have not made a determination that a device will NOT cause interference then it is prohibited (less exceptions in (b)(1-4)). In situations where the pilot makes the decision, his lack of knowledge may just be tough luck for you and your scanner. If he can't determine compliance for whatever reason - you're out of the scanner business on that trip.

There may be a misuderstanding regarding the power of the pilot-in-command. The PIC is the final authority when it comes to the safe operations of an aircraft. The authority to violate an FAR is only under extenuating/emergency conditions where compliance would be unsafe. In the case of portable electronic devices, airlines make determinations under sections like 91.21 that become company policy. The PIC must adhere to company policy just like FARs, whether it's prohibiting electronic devices, when to turn off the autopilot, when to turn on the "seat belt" sign, etc.

>Robert's vitriol notwithstanding, I belive that this paragraph means to
>be interepreted as giving the airline the discretion of banning certain
>FCC classes. Unless you know of some place in the terminal where the
>airline is putting probes on scanners, CD players, etc.

Any pilot will tell you that the only interpretation that counts is the FAA's, and that is not always predictable. You need to read the entire section of 91.21, not just paragraph (b)(5), and maybe you should be familiar with all of part 91 (and in the case of airline operations, part 121) before you make too many liberal intepretations.

There is nothing in the section refering to "FCC classes". But it doesn't say that the airline can't determine the a class B device is OK but a class C device is not. The section does say "...the particular device..." when discussing determinations.

Don't get me wrong, I am not against the use of scanners on board airplanes altogether. But I question their use on board commercial transports. I wouldn't stop someone from using one on board my airplane during a VFR flight. I posted the section because someone asked for it. And those of you that think you are smarter than the FAA, the airlines, and the pilots - you are in violation of the law. But that's just part of it - you might be creating a hazard to yourself, everyone on the plane, and maybe people on the ground. And if you keep doing it, the rules may get worse.

Stego is the program you are thinking of. It's in the cypherpunks
archive, which used to be at soda.berkeley.edu, but all the stuff at
soda has been moved, I think, and I'm not sure where to. Stego puts
information into the low-order data of image files. The one problem
with this kind of concealment is that it's not very efficient...you may
need very big images to store modest amounts of data. Could be handy
for stuff like keyrings and such, I imagine, but I don't think it would
be feasible, to, say, hide your alt.2600 archives in images. Getting at
the data is somewhat clumsy, as well.

>thanx in advance!!
>doug

One useful property of the IF is that if you double it and add it to the
frequency on the readout (or subtract- same effect) you will be able to
receive an "image" of that freq. EG if my receiver has IF of 10.7 MHz, and
I want to get 890.3 MHZ but it won't show up on my dial for some _inexplicable_
reason, I can set 911.7 MHz and get an image of this transmission. (This is
21.4 MHz away from where I'm _really_ interested.)

Of course this phenomenon can cause problems as well, as in NYC where the
police bands (476.4 to 477.2 approximately) are 21.4 MHz away from various
paging services. If your antenna is too long or too high (as when you're
crossing the Gowanus Canal in your car and illegally using your scanner
without having paid the Commissioner of Police $25 for that privilege :)
you will hear all sorts of squeaks and rumbles which interfere with what you
really are interested in.

>Would anyone care to explain exactly what "trunked" means, and how this
>relates to scanning a given "trunked" frequency?
>Thanks in advance!
>Eric

Eric the term "trunk" more or less comes from the telephone industry. A trunk is a circuit between swicthing equipment. Your home phone is on a subscriber loop. When you call a phone on a different exchange the switching equipment uses an avialable trunk to route the call to the other exchange where it is connected to the called party's loop.

Trunked radio does sort of the same thing without dedicated paths to users (no loops) but instead, uses a control channel. When a trunked radio transmits it does so on a control channel. When the central controller sees who is transmitting it assigns a different channel and instructs all radios in the user's group to go to that channel. When the transmissions are finished the radios go back to the control channel and wait for the next round of traffic.

This is how the handshaking works on a Motorola type I system.

Basics.

1. Control Channel will transmit outbound signalling words (OSW) to the radio and receives inbound signalling words (ISW) from it.

2. Control channel contiuously transmits background OSWs in the absence of activity on the system. These OSWs are used for synchronization of the radio and contain no user information.

3. Radios that are turned on will search the four highest frequencies in the trunked channel group until they find the control channel.

Operation.

1. PTT key up. Radio will transmit a request for service (ISW) which is 78 bits long at 3600 BPS (total time = 21.67 ms). This ISW is sent on a precise time slot in relation to the controller OSW and contains:
a. Radio's ID.
b. Fleet and subfleet of which he is a member.
Only 21 bits are information, the rest being parity bits for error detection and correction (FEC).

2. The central controller puts the request for service in a queing condition, and dependent on it's priority, will assign a channel. The quickest a grant

for service can be is about 58 ms after reception of the ISW.

3. The controller send a channel grant 2 times in rapid succession. This 84 bit OSW is transmitted at 3600 BPS and contains:
a. Individual ID of the radio.
b. Fleet and subfleet which is sent to the new channel.
c. Type of call (group/individual)
d. Number of the voice channel to be used.

4. The radio decodes the OSW grant and moves to the assigned voice channel. For a group call, all other radios also move to the assigned channel.
a. At the same time the controller is sending the OSW grant on the assigned channel, it is also transmitting data on the assigned channel called the "high speed handshake".
b. This data is a 21 bit frame, transmitted at 3600 BPS. Data within the frame consists of sync data, ID information and two parity bits.
c. The radio looks for the HSHS on the voice channel to confirm that it has switch to the proper channel.

5. The radio will now key up on the assigned channel and transmit 80 ms of high speed acknowledge tone (1800 Hz).

6. The controller recognozes this tone, removes the HSHS from the outbound voice channel and replaces it with an identical subaudible version sent at 150 BPS and low deviation. Called the low speed hand shake (LSHS).

7. At this time, three optional "talk permit" tones are received by the user, the mic unmutes and voice transmission commences.. The radio will transmit continuous subaudible connect tone (105.88) to the controller that keeps the channel connected.

8. In addition, radios that are sent to the voice channel will also look for the HSHS. If they detect it, they will unmute after detecting the LSHS signal. The best case time from requesting PTT to receiving radios = 280 ms.

9. During all of the voice communcation, the controller duplicates grants on the control channel (OSWs) as time permits. If a receiving radio drops out for more than 1 second, it will return to the control channel and be redirected to the assigned channel.

Termination of Call.

1. When the PTT is released, the radio sends 200 ms of disconnect tone (163.64 Hz at low deviation).

2. At this point the system can be either message or transmission trunked.

a. Message trunking: The central controller detects the disconnect tone and begins a message timeout timer (2-6 seconds). If another radio keys up during this time, the controller resets the timer. If no other radio keys up, the timer will timeout and the controller will disconnect the radios from the channel by sending 125 ms of of low speed disconnect sequence (sync patterns at 300 BPS with low deviation) on the voice channel. The radios will return to the control channel and becomes available for channel reassignment.

b. Transmission trunking: In this mode, the central controller will issue the low speed disconnect sequence immediatly after detecting disconnect tone from the transmitting unit. The radio will remain muted and return to the control channel.

4722. R7100 - Scan Star stop mod problem?

Newsgroup: rec.radio.scanner
Date: 1994-10-31 19:47:07 UTC
From: otoupal@astro.as.utexas.edu
Message-ID: <393hjs$61b@geraldo.cc.utexas.edu>
Source record: 266276

Has anyone done the Scan Stop mod to their Icom IC-R7100 as it is described in the Scan Star documentation? I did it but am having some trouble. Here's what I have:

Icom IC-R7100 - Icom CT-17 interface - Scan Star Professional scanning software. Microprocessor speed-up crystal added to the R7100.

I went into my R-7100 and replaced a 100uF cap with a 0.47 uF (actually a 0.33 as it was all I had). Next, I changed the wiring to turn the relay output connector into an open collector. I was then supposed to add a TTL - RS232 driver chip to send the signal to my computer but since I already have a CT-17 interface, I just stole one of the unused drivers in it and sent the signal down the RS232 Ring Indicator line.

Using the Scan Star Terminal section, I can see the Ring Indicator line changing in step with the squelch control so the wiring seems to be correct.

The trouble I have is when I try to use the scanning portion of the Scan Star software. If I set the radio parameters up for Scan Stop Modification Installed, the scan rate drops to a VERY slow rate. Something in the order of 2 channels/sec. Ouch! If I use the Inverted option of the software, the scan rate is as fast as usual but the software doesn't stop the scan when a signal is present.

Currently, I am back to using the CI-V stop signal and I have email out to the author of Scan Star. I am sending this out to see if there is any net.wisdom about the problem I am having.

By the way. I have had the Scan Star Professional software for about a week now. What a difference it makes! I can now dump a group of frequencies from DBASE into a file, read it into Scan Star, and change all 900 odd channels in just a couple minutes. Sure beats spending an evening banging on

the R7100 every time I get the urge to monitor something
else. The more I play with Scan Star, the more I
think it's a worth while addition to the R7100.

> Upon what information do you base this bullshit statement?

Allow me to answer for him.

Quoting the San Jose Mercury News:

"However, published accounts of U.S. communications surveillance activities-
which are conducted largely by the NSA- state that surveillance satellites
and ground stations in the United States and overseas are able to scan
millions of civilian and military conversations.

By using telephone number prefixes, *keywords* and other selection techniques,
calls of interest to intelligence agencies are picked out of the telephone
traffic and stored in computers." Jul 2, 1988, Page 1A, from article titled
"NSA ACCUSED OF FORBIDDEN PHONE TAPS".
[emphasis on "keywords" was mine, not the Merc's]

Quoting from "Signal Processing of Speech" (ISBN 0-07-047955-0, by F.J.
Owens):

"free-text systems are normally used in forensic and surveillance
applications, where the subject is non-cooperative and often unaware of
the task." (p. 164, in chapter "Automatic Speech Recognition").

As an example of defense funding of speech recognition research, the SPHINX
system was partially funded by the Defense Advanced Research Projects Agency
(DARPA). Ref: Mercury News, July 6, 1988, page 1F, title "ADVANCE REPORTED
IN COMPUTER VOICE RECOGNITION."

Perhaps the other writer was joking about the word "scanner" being used in
keyword searches, but there's a rational basis for believing that keyword
searching is already being deployed to scan conversations.

Are you taking issue with Jared's assumption that the Secret Service gets
a shot at adding their own keywords to the database, or just with the notion
that searches are performed? I hope I've documented the latter well enough
"for Usenet purposes."

Source record: 266302

I haven't played with the Pro-43 much, but I do own a Pro-39 which is very similar.

Anyway, with the 39 I enter the program mode, and press the limit button. The unit shows LO <freq>, where you can then enter the lower freq limit you want. Then I press the limit button again and the unit displays HI <freq>, I can now enter the upper limit I want. After that, I select up or down sweeping by the up and down arrow keys.

As I said, this is for the 39; I assume the 43 is similar.

Unless otherwise stated, expressed view are my own. They may not be the opinions of my superiors, the U.S. Navy, the DoD, nor the U.S. government.

I suspect the NSA is quite more capable than simple keyword
searches over texts and speech; for years they have been
a customer of mine for some of my more exotic natural language
processing knowledge bases. The part-of-speech database,
the thesaurus database, combined with the Pronunciator database,
for example, can be used to match even *paraphrases* of utterances.

The story reported on the net at the time is that he was dumpster diving
at Motorola's Plantation Fl. facility when he was arrested on apparently
trespassing charges. In his possession at the time was a Moto HT
which was programmed for trunking access.

The person "reporting" the story on internet later stated that
it was not him that posted the story, rather someone forged his
account or they gained access to his account to make the post.

It is all a bit strange sounding.

From: fr570@cleveland.Freenet.Edu
Message-ID: <3947m1$c5s@usenet.INS.CWRU.Edu>
Source record: 266297

CTCSS or PL (or Private-Line---PL is a trademark of Motorola) is a continuous tone which is sub-audible. It transmits this sub-audible signal every time you key up on the radio. Listening radios with the detector only hear the message intended for them. For example, a near-by ambulance company uses 461.175 for their dispatch. This same frequency is used by a tow-truck company. Obviously the ambulance doesn't want to hear everything the tow company is doing, so they each have their own PL tone. A disadvantage is that sometimes garbage bleeds over. This often happens when both, unknowingly key up at the same time. PL's are usually used on a system with a repeater or when another agency or company uses the same frequency.

I've seen some Uniden scanners that have an option of CTCSS or PL decoding. By having this, you can narrow what you listen to. If two different companies do operate on the same frequency, you have a choice on which one to use. I'm not sure how many possabilities there are, but there are enough. There is also another form called DCSS or DSS (I can't remember right now. It has the same principle purpose, it offers more codes I believe. These systems can keep some of the spurious static out too. Another disadvantage is that it takes a split second longer for the person hearing to have their radio "open" up; it may cut off the first word if someone doesn't pause slightly after keying up.

Hopefully that answered your question.

In a previous message, Chris talked about funny things over the scanner pre-Halloween. Here in Detorit, the extensive radio traffic was ANYTHING BUT FUNNY as terrorists went to work burning down the town again.

I had the displeasure of watching the firefighters carry two unresponsive little girls out of a 5-sty occupied apartment building that was torched.

Yea, the scanner traffic WAS interesting on THAT one:

"Engine 44 to Central. I'm 2 miles away and I can see it. Send me some help!"

But the night lost its thrill when they carried the babies out.

Oh, how I wish for the good old days when headless drivers and driverless buses, tossed eggs and house tee-peeing were the norm on the scanner at this time of year in Detroit.

4745. AOR AR8000 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-11-01 03:16:02 UTC
From: lgs@midland.co.nz
Message-ID: <394btj$3oc@news.midland.co.nz>
Source record: 266304

I just received my AOR AR8000 from EEB after waiting approximately two months from the date the order was placed with them.

It's well worth the wait - seems to do everything better than ANY other scanner I have and these include an AOR AR3000 and a Yupiteru MVT7100. There are many more scan and programming options and it seems to be more sensitive than the Yupi on the supplied rubber duck antenna (I use an external amplified antenna on the AR3000 so cannot directly compare it although AM VHF reception at around 100MHz seems almost as good on the AR8000/rubber duck as the AR3000/amplified antenna). The audio quality is also better than both other receivers.

Anybody else out there care to compare notes or advise on where to obtain the computer interface and software?

4746. Re: Indoor Antenna

: I leave in an apartment building an cannot use any type of
: out door antenna for scanning.

: Could someone please recommend a good indoor scanner antenna.

: Thanks in advance.

: Smitty

I am in the same situation. I am mainly interested in the 400 & 800 MHz
range, though coverage from 30Mhz to 900Mhz would be even better. :)

pschleck@gonix.com (Paul W Schleck KD3FU) writes:

>How hypocritcal of you, Jeff. This is the same Jeff Herman who drones
>on endlessly about homosexual bathroom cruising and sex acts at his
>University on rec.radio.amateur.policy (almost to the point of making
>even the straightest readers wonder if Jeff had toilet-training
>problems as a child) while ignoring all reasonable pleas to exercise
>some constraint and appropriateness of venue regarding subjects that
>are clearly not radio-related.

Hey Paul - haven't seen anything from you in a long time!

First of all, my `drones' are only in *response* to the LARC
posts and the pro-gay articles that follow it; only in
response - remember that. They're the ones who periodically
use the rec.radio.amateur.misc forum to somehow connect ham
radio and the gay lifestyle. I'm not going to be force-fed
that garbage and brainwashed into thinking that what they
do is normal. But just to remind you, I only *respond* to
their posts. Eventually, the pro-LARC people finally cease
and so do I; it's a shortlived debate and dies as quickly
as it came up.

On the other hand, Rich, on .shortwave, has started a subgroup
within a newsgroup regarding political and non-shortwave-related
articles, that continue endlessly. If a non-shortwave-related
political debate lasted only a week who would care? But his
non-shortwave posts keep coming and coming and ...

I wasn't the first to say something, but feel free to flame me;
it'll help lower your blood pressure! Stress is a killer, you know.

Getting back to the gay/ham radio issue and one of my articles,
you, like a good portion of society, don't like to hear what these
folks do so you blame the messenger when their filthy little acts
are revealed, such as their activities in the campus restrooms (I'll
you a copy of our campus newspaper's articles and campus memos
about how the restrooms have turned into brothels just so
you don't think I make this stuff up). I'm just the messenger, Paul,
responding to the pro-gay articles; ask *them* to stop and I certainly
will cease, also (you've got to be fair now!)

> You've
>helped turn the radio-related Usenet newsgroups into what they are today,
>Jeff (both the bad and the good), take some responsibility for your

>actions.

Gee, thanks (I think...), but I'm not sure how I am responsible for
non-radio related articles flooding .shortwave.

73 Paul (and watch that blood pressure!),
Jeff NH6IL

4748. 900 MHz cordless telephone evaluations

Newsgroup: rec.radio.scanner
Date: 1994-11-01 06:54:51 UTC
From: dsrekcc@prism.gatech.edu
Message-ID: <394onr$1el@acmey.gatech.edu>
Source record: 266307

This is a final, updated version of an info file I posted a few weeks ago.

Changes made: AT&T not Spread Spectrum, since OEM'd from VTech
Added data on Sony
Mention of Uniden features
Approximate prices added to table
Cobra model added to table

About a month ago I put out a call on the net for your comments and
experiences with 900 MHz cordless phones. The following is what I
finally distilled out of those responses. Note that these are
actual experiences, not rumor or manafacturer's claims (nor mine).
If your phone does not exhibit the performance problem indicated here,
or if you find a better price, well, great.

Below is a table of some basic performance comments, followed by more
lengthy comments on each model. I received over 2000 lines of comments,
and have edited _that_ down to 1300+ lines (~60K). Since posting those
comments would be an ENORMOUS waste of bandwidth, I will e-mail a copy
of that file to whoever really wants it.

Talk Handset
MODEL $ SS Sound Quality Range (ft) Duration Size
--- --- --- --- --- --- ---
AT&T 9100/9120 250 No* hissy, tinny "Good" Wide
BEL 900 260 No crystal clear "1 block"
Cobra CP 900? 250 Yes? good 1000 "Block"
Escort 9000/9020 300 Yes good, crappy 2.0 hrs
Panas. 9000/9220 330 No excellent "few 100" 0.5 hrs Flip
Sony SPP-ER1 250 No clear 200+ 4.0 hrs? Big
Tropez 900 DL/DX 200 No* noisy, artifacts 300-1000 1.5 hrs Difficult
Uniden 9100/9200 270 Yes good but echo 500 Good

$: General prices found at electronics retailers locally.
Mail-order vendors include Hello Direct (800-HI-HELLO), Shoppers
Advantage (800-835-7407), and TeleDynamics (800-847-5629).
SS : Spread spectrum encoded - This means that you're not broadcasting
your voice across the neighborhood, for all scanners to hear.
While a few people might be able to decipher it now, and some
scanners may do it in the future, you are at least secure from
95% of the "snoopers" out there. Me included.
If it's not SS, then you _can_ pick it up with a simple scanner.

COMMENTS:

AT&T
- 9120 is a speakerphone
- AT&T phone is OEM'd from VTech, the company that makes the Tropez.
The ergonomics are better, but the performance is about the same.

Escort
- The "good, crappy" comment in the table means I got conflicting
responses.

Panasonic
- Flip-phone style
- Dual batteries; extra battery does NOT power base in power outage.

Tropez
Note: while many people disliked the Tropez, some vehemently,
I should say that I received a few responses defending it.
- 900 DX is a speakerphone
- Range is apparently very good, at 1000 feet or more.
- The Tropez models are NOT spread spectrum. They use a single channel
16 kHz PCM signal about 100 kHz wide. While this means that Joe
Scanner can't pick up an easy FM signal, it also means that it is not
quite the level of security offered by spread spectrum. The digitized
audio is apparently coded to a random, shifting key (64K combinations),
so interception is still unlikely. On a plain scanner, your voice is
indeed unrecognizable (digital).
This applies to the AT&T models also, since they are OEM'd from Vtech.
- It has been reported that clear audio (FM) leaks at around 430 MHz.

Uniden
- 9200 is two-line phone, with speakerphone. I could not find it on sale
locally (major city), so mail-order may be the only way to get it.
- Both 9100 and 9200 have ability to charge extra battery (extra $).
Extra battery WILL power base in power outage.
- Almost everyone liked their Uniden, except for the echo.
The echo (and some said clipping and distortion) appears only in
your earpiece; the other person can't hear it, although you may
find it very irritating. Many were not particularly bothered by it.
- Many commented on complete set of features (external monitor speaker on
handset, extra battery powers base, lighted buttons)

Miscellaneous

- General Electric, Radio Shack and NorthWestern Bell models are possibly
OEM'd, but I have conflicting information on that. They are apparently
not spread spectrum, but just broadcast your audio in the clear (FM).

- Motorola makes a 49 MHz cordless phone that reverses the audio into
something unrecognizable on a scanner. There's one of these in my
neighborhood; a plain scanner won't work on it, but it is pretty simple
to build a circuit to un-reverse the audio (see rec.radio.scanner).
There are a variety of models from $180 and up.

- From the FAF - Frequently Asked Frequencies file on oak.oakland.edu -

Panasonic KX-T9000 base 902.100-903.870 { 60 channels
handset 926.100-927.870 { 30 kHz spacing

VTech Tropez 900DX base 905.600-907.500 { 20 channels
(digital) handset 925.500-927.400 {100 kHz spacing

AT&T #9120 902.0-905.0 / 925.0-928.0 }
OTRON CORP. #CP-1000 902.1-903.9 / 926.1-927.9 } unconfirmed
SAMSUNG #SP-R912 903.0 / 927.0 }

4751. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-11-01 08:00:32 UTC
From: bill@thd.tv.tek.com
Message-ID: <394sj0$1he@news.tv.tek.com>
Source record: 266309
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 06-Oct-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

| Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US
| and is available with or without mapping support. The mapping version
| brings up a map with the requested station plotted on it. The regular
| version is $100, and the mapping version is $170 (shipping extra).

Floppies are available by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL). Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

| RADIOMAP SERVICE

| Developed by long-time Usenet contributor Bob Parnass, this service prints
| an 8.5" X 11" color map of an area with transmitter sites shown. Included
| are key sheets that list frequencies, callsigns, and licensee names.
| Ranges of 1/2 to 10 miles are available. The service is currently
| available for the following states: IL, IN, MI, MS, NY, OH, PA, WI.
| Additional states are being added. Contact Bob for more information. To
| print the map, Bob requires the latitude and longitude (or nearest street
| intersection) of the center location. Maps are $20 each. Write to Bob
| Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839
| between 6-10 PM central time. Bob asks that you do not send him e-mail
| regarding this service [probably because his e-mail account is supplied by
| his daytime employer].

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services at all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

| US SCANNER PUBLICATIONS

| Similar in style to Police Call, this series of directories covers ALL
| radio services between 30 MHz and 2 GHz. Each volume covers one state and
| costs between $14 and $29, depending on the state. The volume for
| California is 820 pages. Contact US Scanner publications at 800-890-6999
| (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

: that doesn't know the code.
I've got a Maxon 10 ch. cordless speaker-phone. The digital read-out on
the base unit shows that it's scanning, until it receives it's code from
the hand-set. Then it locks on a channel. Does anybody know how this
"scanner" can be modified to lock onto ANY active frequency, regardless
of the code received? (i.e. clip a diode...test mode...etc.)
thanks,
chuck...

> 2400 bps modem?

We now have a software package that will decode ACARS "stuff".
Needs 386 minumum and just plugs from your 3.5 audio socket on
your receiver into the com port on the PC.

Software does the rest.

: serial, diodes all over the place.

Just out of curiosity, what was the date of manufacture? You'll find it
inside the battery case <number>A<number>. The first number is the month
of the year, the second number is the year less 1990, e.g. 4 = 1994.

Chris... have you tried the high-band vhf freqs listed? Check out 155.13 which shows in Scanner Master as the Auxillary Police... also give a listen to 154.965 which is the twons Public Works frequency.

I also heard a rumor that there are several communities in the NEMLEC systems using 485.3875 (or 487.3875) for drug related stuff... this is the 5 MHz up freq from the Tac 4 used as a car-to-car channel.

Give it a try and let me know if it works!

Having moved to Boston from the Detroit area 12 years ago... I wonder what is happening in Detroit when I read all about this kind of stuff. I was in Toledo when the riots occured in there in the 60's and it was a hideous thought about this kind of stuff happening so close!

I was reading about it... where they had 40,000 volunteers on the streets 2 years ago... but only 6,000 this year. What a shame that the city was proved wrong by the year off!

I think the mild weather was a major influence... with it being so warm both Devil's Night as well as last night for Halloween... that it brought out the worst of the crowds!

Good luck Detroit in solving this problem.

4761. advice on handhelds

Newsgroup: rec.radio.scanner
Date: 1994-11-01 13:11:08 UTC
From: steim@hacktic.nl
Message-ID: <steim-0111941511080001@slip37-250.xs4all.nl>
Source record: 266323

Can someone help an outsider/novice (to both scanners and the net)?
I'm a composer who uses a lot of live radio broadcast in live performance --
mostly AM/FM/SW, but I did one project a few years ago with a borrowed scanner
where I puled in a lot of public service, ham, and ship-to-shore phone material.
I'm now looking for a portable scanner, as small as possible (handheld?) that
will do as many bands (including cellular) as possible.
In Amsterdam airport duty free I've looked at:
Sony AIR7 (c.US$400)
Sony ICF PRO80 (c. US$500)
an ICOM tiny handheld @ c. US500 that the salesman proposed as superior to the
Sony at the same price -- "full range with no missing frequencies" (I assume
this means cellular?)
Any suggestions/advice?
I see frequent mention in this group of Realistic Pro43 -- is it portable?
Why the kudos?
Sorry to be longwinded. Thanks for the help.

Also, be sure NEVER to allow them to be recharged. While researching the safety stats on lithium batteries for one of my system designs I found there have been horrific results from accidental charging; blown out windows in a lab in England from an accidentally charging lithium batt-pack in a cam-corder, not to mention a cell-telephone manufacturer testing rechargeable lithium technology (phone blew up in user's face). Lithium is great for average use but I won't subject them to extreme current draws where the battery will heat up. I won't even put them in my baby monitor.

Source record: 266228

Hello Folks!
I recently posted a note requesting Military frequencies that could be received in the Seattle Washington area.

The response was overwhelming! Over 20 different people posted or sent email directly with frequencies, book suggestions, or general encouragement!

My sincere appreciation to all of you for taking the time to help me out.

One book that was NOT mentioned, that I have discovered was The "Top Secret" Registry of U.S. Government Radio Frequencies 25 to 470 Mhz by Tom Kneitel, K2AES.

This book has an AMAZING number of military frequencies for military installations and military frequencies at civil airports.

Additionally, there are TONS of listings for other government agencies as well.

The 7th edition has a several pages of Canadian frequencies listed.

I can't vouch for the accuracy of the frequencies, as much of the list is outside my home reception range, but the listing seems VERY comprehensive!

I will be posting my list of Washington military freqs as soon as I get it all condensed and prettied up.

Thanks again, and keep listening!

>Digital Backbone. However, this system will be under construction over the
>next several years.

The Arkansas State Police have a statewide SmartZone (I thought they were
called SmarTone ...). Very nice system.

>Good Luck Following These Conversations :)

Au contraire. The system here (I don't know if this applies elsewhere -
BatWing trunking systems are known for their "reconfigurability") is set
so that the data channel never rotates and the groups are assigned to
frequencies in a logical manner. Very easy to listen to (for a trunked
system). And with more and more SOs switching from 37 MHz to the ASP
system, it's getting *easier* to listen to law enforcement.

From: mconner@rain.atms.purdue.edu
Message-ID: <395slm$sct@mozo.cc.purdue.edu>
Source record: 266234

In an article about the Americal Eagle crash here in Indiana yesterday, our local paper had a quote from an Indiana State Police officer who was talking on the radio. He was describing something or other about the crash site. The article was explicit in saying this was ISP radio traffic.

Isn't this illegal, even for newspapers? I was under the impression that the 1934 Communications Act prevented the use or publication of *any* radio traffic (except amateur and broadcast). Can someone quote me the sections out of this Act that covers this?

BTW, this is the same paper that complained about police officers that used scanners to gather info about drug dealers that used cordless phones.

I'd like to get together with other scanner hobbiests in Central Mass (Worcester area) to form a radio notification group. This group would announce any "action" they hear on the radio over a GMRS or a ham frequency to other members of the group.

These groups are active in some of the larger cities but I am looking to form something less formal. I have a good hilltop to put my GMRS repeater or a simplex ham repeater on. These could be dedicated to the group's activities.

Anyone interested?

Personally, I don't want to have to search 10 newsgroups instead of just
one. I can tell (98% of the time) what a thread is about by looking
at the title. Most threads get corrupted somewhere along the line and
the discussion turns out nothing like the subject title.But that will
happen no matter how you structure the newsgroup. I say leave it as
it is.I don't want it to be reorganized. But that's just one opinion.
Dave

Paul Cordingley (paul.cordingley@canrem.com) wrote:
: Is there a usenet guru out there who can explain exactly how to
: start a reorganization of scanner-related newsgroups? Do we circulate
: a petition? Is there a body that approves new discussion groups? To whom do
: we address our views? Is there a voting process?

: A number of writers in this newsgroup (myself included) have already
: commented that the breadth of material, while all valid, has become
: inconvenient. Some sort of subdivision would help the reader get to
: specific topics quickly, and those who have the time and interest to
: digest it all can still read all the newsgroups.

: So, assuming there are others of like minds, how does one start things moving?

: Regards, Paul

: PS: While I'm on my soapbox, my personal opinion of what to do is:
: Establish a new newsgroup limited to exchange of technical information -
: eg VHF/UHF radio theory, transmission line and antenna theory,
: monitoring techniques, information on how UHF/VHF systems work
: and how they are used. Discussion of *NEW* equipment and modifications would
: be acceptable, as would listing of *NEW* or topical frequencies....
: but those seeking well-documented information on freq's, mod's
: or 'old' equipment would be politely referred to FAQ's or FTP sites.
: The existing alt. and rec. scanner groups would remain for far-reaching
: discourse on other topics just as they are used now.

> minutes.

Really! What fields are in the DBASE file?

One of the problems I have with the ICOM CT-IV protocol is that it
doean't allow a complete readout/backup of the radio settings.
Specifically, it is not possible to read the scan bank number (darn it)
or the scan spacing interval (for channels 900-919).

When I asked ICOM about this, I was told that the protocol was not
designed with backup in mind. They suggested that it was possible to
write all parameters, so I should just keep all the info on my
computer and make mods there. Then download it into the radio.

Maybe they have a fleet of trucks that need to be contacted. Perhaps
they have to deliver supplies etc from a centralized warehouse?

I don;t think that is too uncommon..

: relates to scanning a given "trunked" frequency?

Here is an article posted a while back in rec.radio.scanner which
should help you out. All credit goes to the author noted at the end.

-Andy R.

```
================================================================================
HOW A TRUNKED RADIO WORKS
================================================================================
```

There are several kinds of trunked radio systems; I'll describe the
Motorola one since that's the kind I was trained on several years ago. The
others aren't too different, I'm told.

Typically there are at least 4 channels in a trunking system. They are
really repeater pairs; most often in a small system, all the repeaters
are at a single location on a good hill or tall building. One channel
is the control channel and continously transmits digital codes (3600
baud, if I remember right). In a Motorola system, the control channel
shifts between the repeaters in the system every 12 hours to even out
the wear on the equipment. Larger systems (like San Diego's 14-channel
trunking system) will have multiple control channels, usually spread
around different sites for better coverage.

When a mobile (or portable) is first turned on, it scans all the
channels in its system until it finds the control channel. (If it
can't find it, you'll get an error indication.)

When you key the radio to make a transmission (after an idle period),
the radio sends a quick digital request containing your unit id and
the 'call group' of who you want to talk with to the trunking
controller, which is listening on the input of the repeater that is the
control channel at that time.

The controller selects an idle repeater channel, and then transmits a
command that tells your radio to switch to that frequency. If all
channels are busy, you get an error indication. All the other radios
in the selected talk group will also switch to that frequency.

(A talk group may be everyone on your system, just a few units, or one
specific unit. It's completely programmable.)

While the conversation continues, you'll all stay on that frequency.
After a configured idle period (which can be short or long), you'll all

return to the control channel, freeing up the repeater.

Whilst you're on the talk channel, a continuous subaudible digital code (63 baud? don't remember!) is sent to confirm that you're on the right channel and that you should stay there. It can also instruct you to switch to another talk channel or to return immediately to the control channel.

MDT (Mobile Data Terminals), alphanumeric pagers, and mobile status indicators (in service, out of service, man down, emergency, hijack, etc) can operate on the digital control channel without needing to allocate a talk channel, although in a busy police system, it's likely that MDTs have their own channel.

It is possible to poll a mobile to see if it's in service; it's even possible to reconfigure the mobile remotely in the more advanced systems. I see no reason to believe that it is impossible to remotely command a mobile to transmit, but I don't think that would be practical as an eavesdropping technique, since typically the microphone is out of the circuit unless the button on the mic is pushed, and because most mobiles have blab-off timers to prevent a wedged microphone from jamming a channel for long. It could be done, though.

The voice transmissions are normally standard 5 (or 3) kHz deviated FM, but they can be digitally encrypted if the system is so equipped. That's pretty much separate from the trunking function. (As a side note, the Motorola digital encryption is done by digitizing the signal using a CVSD coder doing the A/D/A conversion; as I recall, it's like a 12kb/s code. To me, it sounds really muffled - too low a sample rate for my taste. Obviously they had to do that to fit it into standard channels.)

I understand that the Johnson and G.E. systems work similarly, but don't leave the controller transmitting continuously. They may use different baud rates too.

To monitor a trunking system on a scanner, you pretty much have to program all the frequencies into your radio. In the US, you can get them from the public copy of the station license. However, if the system gets busy, and the idle homing timer is set short, you'll have a lot of trouble finding a specific conversation.

I think it would be really cool for someone to make a trunking decoder that could be attached to a scanner that would instruct it to follow a specified bunch of talk groups as the channel assignments took place. No doubt it'll cost a fortune.

In the mean time, the only technique that occurs to me is to get a used trunking radio and pursuade a radio tech to program it the same as one of the official radios. Whatta pain!

The problem is you're being forced into these deals, in which often the only one really benifitting from some of the onerous contracts are the cellular retailers. How would you like it if grocery stores started to demand that if they're going to sell you groceries at a reasonable price, that you must sign a contract saying you will shop there for at least a year and agree to buy so much. And if you don't you'll be charged an early termination fee of several hundred dollars? People would be up in arms if this was the case with grocery stores, but this is what is happening with cellular retailers, but is far worse if you really knew what they were up to.

> scanning? Or is there an even better scanner (complete range) out there?

It's getting harder and harder to find modifiable scanners that are new.
Most inventories are depleted of them by now. As far as gaps in the 2006,
you can't get anything above 1,300 mhz, but I doubt you would find much
up there worth listening too. There is also the 520 - 760 mhz gap. In
there is just some of the UHF television band. I suggest buying a TV set
for that. You also get nothing below 25 mhz, in which you would be
better off buying a nice shortwave radio for that. Many scanners that
do scan down there don't do a good job. Also, lower frequencies do
usually require longer antennas, especially listening to foreign short-
wave broadcasts. Hope you find a good scanner, but if you can't, the
2006 is still an excellent scanner, although the scan speed (26 channels
per second) is on the slow end when compared to many of today's scanners.

That is exactly what it says. However, the pilot is free to go further, if he feels that a particular device (allowed by the operator) is a hazard to safe flight. It does not matter at all how knowledgeable he/she may be about electronic equipment - all that matters is the pilot's perception of any hazard. This is written into FAA rules in a number of places, where the PIC (pilot in charge) is the final determinant of safe operation of the craft.

4809. RE: AOR AR8000 Receiver

Newsgroup: rec.radio.scanner
Date: 1994-11-02 03:50:03 UTC
From: toast@aol.com
Message-ID: <39729b$gd5@newsbf01.news.aol.com>
Source record: 266186

I have been using an AR8000 for about 3 weeks now and I am really satisfied with it's performance. The sensitivity is really nice, I have also been able to recieve signals (kind of weak, but listenable) below 25Mhz band. The best feature for me has been the 20 programable search banks and the Alpha/Numeric display is really nice too.. I have read the manual from front to back and at this point, I haven't had the need to go into the EXPERT mode. The only thing I don't like so far, is that you can't select bands on and off on the fly like, say with the Pro 43. You have a feature called Band Linking, which you select which bands you can scan through, but it takes a few extra steps.

I do recommend this scanner, but it is a little pricey.

:
: On my PRO34, I receive what sounds (to me) like an unmodulated
: carrier, which slowly (very slowly) rises in frequency, starting at
: approx 150.000MHz, going up to 160.000+ Mhz or so. The change is very
: gradual; I can listen, for instance, to the Co. Sheriff (155.415),
: where the carrier will slowly "rise" to the frequency, interfering with
: the reception of the Sheriff. I can increase the squelch, and this
: works until the carrier keeps the squelch open (full squelch). Then,
: the carrier slowly drifts higher, I can reduce the squelch, and
: everything is ok again - the carrier slowly slides onward up the
: frequency scale.
:
: I've just started noticing this odd behavior in my PRO34. It does not
: seem to be a " local" problem. Trips to Cincinnati/N. Kentucky (50+
: mi away) show identical "interference".
:
: Am I just a victim of intermod with this single-conversion scanner? Or
: is my 34 due for replacement?

I think your 34 is due for repair or replacement. This sounds like a
problem internal to your scanner.

Does the frequency jump back down to the lower frequency or just keep rising
to the maximum frequency. If it stays up, then it sounds like a component
has become temperature sensitive. If it jumps back down, while the scanner
remains on, then it may be a capacitor somewhere.

One clue is the strength of the signal. If it were that strong on the air,
then the police (and others) would be complaining.

Ok to take the knob off, you pull off the rubber grip ring which surrounds
the outside of the knob, and there are setscrews which are cleverly hidded
behind the rubber. You know what to do next!

What kind of building is it? If it's concrete and rebar (like mine),
it's a lot tougher than, say, a single story wooden structure.

If it must absolutely be indoors, try making an antenna from 300 ohm TV
cable (the flat twin lead stuff, cut to the frequency of interest) and
placing it across a window.

My landlord also frowns upon an outdoor antenna. I've mounted a
discone on my outdoor balcony. Since I live on the 8th floor, it isn't
too visible from the below. The management hasn't asked me to remove it
and it's been there for 2 years. (Of course, I haven't really pointed
it out to them..)

> example the Intercity 225s or Network SouthEast?

Do you mean is it legal or what frequencies do they use ?

Legally its against the law to listen unless you work for the Company
involved and the transmission was intended for YOUR receiption.

Quite a bit of London Transport & BR seems to be in the 165Mhz PMR
band together with 200/210MHz area.

> On the same topic, how about listening to public transport on the Continent?

Might be a bit of a sticky wicket in certain places. For example the only
frequencies "receivers" could receive in Germany not so long ago were the
Amateur bands and broadcast radio - it has been relaxed recenetly but
I am not usre of the exact "what you can & can't listen to" laws.

Like the U.K. discretion should keep you out of trouble - I have
used scanner in most parts of Europe without any bother but only for the
aviation bands. I would be careful in France, Spain and such places as
Greece. Mind you I guess it pretty much a waste of time unless you
speak the lingo :-)

: > systems of the aircraft on which it is to be used.

: Certainly you may presume to read this paragraph as saying that the
: airline is technically determining whether any particular device causes
: interference. I would belive a lay-person (rshepard@interacces.com)
: could believe this, but I'm sad that the poster, a private pilot, seems
: to accept this interpretation.

: Given that the pilot of any plane I'm flying is patently inappropriate
: to determine whether any particular device will cause problems, save
: having us operate said devices one at a time, this interpretation is
: silly. The FCC is the governmental body that determines the
: interference generated and assigns a particular FCC class (residential,
: computational, experimental, etc.) to the device.

: Robert's vitriol notwithstanding, I belive that this paragraph means to
: be interepreted as giving the airline the discretion of banning certain
: FCC classes. Unless you know of some place in the terminal where the
: airline is putting probes on scanners, CD players, etc.

: >It is amazing how many people think they are exempt from federal
: >regulations. Only to again be suprised when a new tighter law emerges due
: >to their lack of obeying the origional law due to their "personal belief
: >exemption". How many of you idiots are going to make sure that scanning
: >becomes outlawed all together?

: Robert: drink decaf, get a life, exercise, and have your blood pressure
: checked. It's only the 'net. We're not out to get you. Really.

I was not under the impression that anybody was out to get me. And no
the airlines do not have the technology or the time to check every
electronic device. But the FARs and the FCC both have a say over what
happens on board aircraft in respect to electronic devices. Individual
airline policy aside, FARs in no uncertain terms basically says the pilot
in command is for all purposes "GOD" of his aircraft. Anybody who hops
on a plane with the idea of being exempt from his authority, could be in
for a very unpleasant greeting at the end of the flight.

No boiling blood over this on my part.

It just strikes me that other scanner users would not consider what there actions do to the image of this hobby, which is already pretty bad in the eye of the general public.

And for the record, I am hardly a "layman" when it comes to both communications and aviation. I hold several Radiotelephone licenses and work as a field engineer for one of the larger communications companies. I also hold a multi engine / turboprop / instument rated pilots license.

I am by no means an expert, but I think I've got a pretty good idea of what I'm talking about.

:)

I have never had any trouble understanding the confusion. It is you that
is confused. If what Paul said was true, there was no slander.

It is intersting that I received a telephone call from another
person about two days before Paul's post. The caller, whose name
need not be mentioned here, said essentially the same thing about Jeff's
rantings regarding the Lambda Radio club, gays cruising the bathrooms
etc. Jeff, you have got quite a following! By the way the caller
was not Paul.

[Article crossposted from alt.conspiracy]
[Author was an147006@anon.penet.fi]
[Posted on Fri, 28 Oct 1994 03:11:46 UTC]

Gov. polling troops on whether they'd fire on fellow Americans!!!

Info from the Nov. 1995 issue of GUNS magazine vol.40 no.11-479
page 32 article by Massad Ayoob (a mega-name in the gun world for
those of our un-armed a.c. readers)

Ayoob starts out by saying that in August he printed that he had
heard that " Our Government is polling soldiers on whether they would
be prepared to open fire on American citizens.."

He then states that someone from Twenty-Nine Palms Marine Base in
Ca smuggled out the questionnaire. It contained this question;

"The US Government declares a ban on the possession, sale,
transportation, & transfer of non-sporting firearms. A thirty (30) day
amnesty period is permitted for those firearms to be turned over to
local authorities. At the end of this period, a number of citizen groups
refuse to turn over their firearms. Consider the following
statement:
I would fire upon US citizens who refuse or resist confiscation of
firearms banned by the US government."

Spaces were marked for responses on a "Strongly disagree"; to
"Strongly agree" continuum.

Ayoob's inquiries into the question were answered with the reply that
this was just someone's "master's thesis" research... THEN (!!!!) the
article goes on to say that Ayoob was informed that the thesis was
sparked by a desire to gauge how US troops would work with a UN
force in disarming Americans as part of a world effort to
demilitarize the USA!

!!!!!

To find out more about the anon service, send mail to help@anon.penet.fi.
Due to the double-blind, any mail replies to this message will be anonymized,
and an anonymous id will be allocated automatically. You have been warned.
Please report any problems, inappropriate use etc. to admin@anon.penet.fi.

The above was posted anonymously but several months ago I heard of this
questionaire from the For the People broadcast by Chuck Harter.

....drop you're scanner and come out with your hands up! :-(

It depends on what kind if scrambling they are doing. If it is speech inversion, it is easy to crack. Other systems may be unbreakable from a practical perspective.

Be advised that it is illegal under federal law to intercept scrambled communications. The definition of intercept used in that law is to actually extract the information carried. So if you were to listen to the signal while it was scrambled, it would be legal provided it was not carried on a cellphone or cordless phone.

Try a GMRS antenna - they're in the 462 MHz range, and should work nicely.

4833. Realistic PRO-43 or AOR AR1000XLT

Newsgroup: rec.radio.scanner
Date: 1994-11-02 17:20:41 UTC
From: evincent@sargas.usc.edu
Message-ID: <398hp9$qlm@sargas.usc.edu>
Source record: 266184

I'm preparing to buy a new handheld scanner. It's been about 10 years since I purchased my last unit (A Bearcat desktop unit).

I was looking initially at the Radio Shack Realistic PRO-43 but I picked up a copy of Popular Communications and saw several advertisements for the AOR AR1000XLT. Now, both units are about the same price (the AOR is slightly higher), but it seems the AOR is superior to the PRO-43. Specifically, it looks like the AOR has all of the features of the PRO-43 but offers a frequency range of .5 - 1300 MHz with no gaps and does not have cellular blocked. Also, the AOR provides 1000 channels as opposed to only 200. The AOR also comes with NiCads, an AC charger and a case.

Can anyone tell me why I shouldn't buy the AOR AR10000XLT???
I'd also appreciate any feedback owners of this particular model might have.

Thanks in advance,

Eric Vincent

Radio Shack sells a small (about 3 foot) telescoping center-loaded antenna that simply replaces the short whip antenna the scanner originally came with. I think it cost about $20. It does a better job than the whip. I don't listen much to the 800 Mhz region.

If you have a favorite tight low frequency range, you might try building a 1/4 wave antenna for that frequency. Cut two wires (18-gauge is OK) and run them along the wall-ceiling joint in your apartment so that one end of each wire meets in a corner. Run coax from your radio to the corner and solder the ground to one wire and the center to the other. Each wire is 1/4 wavelength. May not be the best set-up in the world, but is very cheap and rather inconspicuous.

You will not need a supercomputer, or anything even close to a 386. Once you know what is being done to the audio (the hard part) you only have to "undo" whatever it is every 100 microseconds (at the rate of 10 kHz for 5 kHz bandwidth audio). Right?

Ok, I went out and bought the 2026 yesterday. I needed a good mountable scnner for my car. This one has the bracket for car, and a stand for your desk or whatever. Anyway, this is probably the best mobile scanner (not handheld) that I have found. To mod it, it literally took me 3 minutes. You remove 4 screws, pull the case back 3 inches, cut a jumper, and you're in business. It only has 100 channels, but that's ok for mobile use. I highly recommend picking one up if you're in the market. It is on sale for 149.00 right now.

4841. Caller ID

Newsgroup: rec.radio.scanner
Date: 1994-11-02 20:36:48 UTC
From: kwong@ee.ualberta.ca
Message-ID: <398t90$gf7@quartz.ucs.ualberta.ca>
Source record: 266131

Would a Caller ID display unit fed by a scanner tuned to a cordless phone (or cellular phone) function properly? I know there are at least a few requirements.

* The scanner must be tuned to the cordless phone being called.
* The owner of the cordless phone must be a Caller ID service subscriber.
* The Caller ID decoder on the cordless phone base transmitter must not filter out the Caller ID signals or codes.
* The base transmitter must send the ring signal to the phone handset by radio. I think all handsets do get their ring through the air as opposed to an electrical connection when resting on the base/charger. (I am assuming that the Caller ID is embedded in the ring or sent inaudibly immediately after the ring.)

Of course, nobody in the United States should do this -- unless they switch to another frequency right before conversation begins. Or is monitoring ring signals prohibited as well? :-)

A non-=transmitting= scanner? I missed the earlier parts of this thread, must've been a good one.. :)

Maybe that's what I'll do when I take in my [near-dead] PRO-44 this week for the local shack's "Fall-Fixit Sale" [bring in anything even remotely like a Radio Shack electronic product, they'll fix it for a set price agreed on by you and the manager, plus $10].. "Yeah, this scanner doesn't transmit anymore.."

Actually, it doesn't receive worth a damn, either.. cracked circuit board. I don't think a set-price plus $10 in parts is gonna save this thing. Luckily, my birthday is in a week and PRO-43s are on sale for "only" $350 or so. [Regular price in Canuckbucks is $480.] :)

: Ok to take the knob off, you pull off the rubber grip ring which surrounds
: the outside of the knob, and there are setscrews which are cleverly hidded
: behind the rubber. You know what to do next!

Maybe not. Icom often uses hex head setscrews. Ordinary screwdrivers won't
work. You remove them with Allen key wrenches. Not quite as obscure as the
screws used in Collins gear, but enough to befuddle the newcomer.

Unanimous Nod For Wiretap Bill

[from Technology & Liberty]
[By Clark Matthews]
[in The Spotlight November 7th, 1994]

The so-called Wiretap Access Bill, S. 2375, passed at 10:30 PM. on Friday, October 7th,1994, with "the unanimous consent" of the U.S. Senate. It is likely to be signed by President Clinton by the time you read this. Two days previously, on October 5th, the U.S. House of Representatives passed the identical bill, H.R. 4922, by an overwhelming margin. There was no floor debate on the bill in either house. There was no reading of the bill. In fact, the final Senate vote happened so quickly that observers watching C-SPAN actually missed it. Nevertheless, a Senate vote unanimously passing the "Wiretap Access Bill" is recorded as having occurred at 10:30 PM, October 7,1994.

MANUFACTURING 'CONSENT'

FBI Director Louis Freeh personally visited every U.S. senator to lobby for the bill. I've even heard reports that Janet Reno accompanied Freeh for some of these little chats. Nevertheless, several senators positioned themselves to stop the vote on the bill, notably Howard Metzenbaum (D-Ohio), Edward Kennedy (D-Mass.) and Patrick Leahy (D-Vt.). All of them placed "holds" on the bill in the days before the final vote. These "holds" permitted any of them to prevent a vote and stop the bill in its tracks. But none of them did. Each of these senators received a personal visit from FBI Director Louis Freeh in the days before the senate recessed for the fall elections. and none of them exercised their right to stop the bill. So there were no objections at 10:30 pm on Friday, October 7th, only "unanimous consent." No one in the Senate voted for the Wiretap Accesa Bill (or against it). No one left any fmgerprints. Ask your senators and they'll tell you no one's responsible. We shall see. In the end, this unstoppable bill slithered silently onto the books in the contemptible tradition of the 16th Amendment, the Federal Reserve Act and many other landmark frauds and fixes that have dearly cost our country's liberty, treasury and sovereignty. Late at night and out of sight, no one was responsible for passing the bill. And no one is to blame. A few days after this grubby victory, FBI Director Louis Freeh spoke at the annual A1 Smith dinner in New York City. Flush with his success with the Wiretap bill-and with the amazing silence of key congressmen and senators after Freeh's personal visits-Clinton's FBI director compared himself favorably with J. Edgar Hoover. The audience gave up a big laugh for America's "reinvented" Hoover sans perfume, ponies, peignoirs

and roommate Clyde, of course.

DIGITAL TYRANNY

The Wiretap Access Bill, as critics call it, was uroposed by the FBI and Janet Reno's Justice Department as the "Digital Telephony and Privacy Improvement Act" of 1994. The bill took its language from the computerized features of automatic, remote-controlled surveillance and eavesdropping equipment that is now being built into America's new telephone networks to spy on citizens. Freeh's and Reno's "Privacy Improvement Act" had nothing whatever to do with improving people's privacy. Instead, it aimed at eliminating people's privacy by effectively converting citizens' telephones into remote-activated listening devices and call-tracing systems. The Wiretap Access Bill simply legalizes these surveillance devices that are already in use in large parts of our country. It also forces taxpayers to pay $500 million for them. The Wiretap Access Bill effectively eliminates the bothersome Constitutional requirement that the FBI obtain court authorization to tap your phone or bug your house through your telephones. That's because your local telephone company can't tell what the devices are doing and, therefore, can't know whether the surveillance is legal or not.

AUTOMATIC GESTAPO

You see, the new equipment is remote-activated and it's designed to be installed on the telephone network (not in phone company offices). It gathers much of the same information about your calls that your phone company does-but the FBI (or whoever) clearly doesn't want your tele-phone company to know what information it's gathering. Or how much it's gathering. So the devices run "encrypted" to conceal what they're doing from telco employees, some of whom might become alarmed by the extent of federal surveillance or start asking troublesome questions about court orders and warrants. Even if your friends at the phone company were interested in safeguarding your rights, they will probably soon discover the same fundamental truth learned by citizens in places like the Soviet Union and Nazi Germany: It's not a good idea to ask questions about court orders when it comes to secret police surveillance operations. The question of court orders for surveillance is further subverted by the bill's requirement that your local phone company provide instantaneous, contemporaneous wiretapping capabilities to the FBI. It seems our rapidly "reinvented" government wants instant gratification-it has no time for trivialities like presenting court orders. The monitoring equipment doesn't ask for a warrant before tapping your calls or bugging your office (or your bedroom). Someone thousands of miles away simply presses a few keys and the equipment just does it. They can always find a court order somewhere if they need one. Either way, no one will know what they're up to. For that matter, the equipment can do this for whomever has the "key codes" that turn on one of these devices. It doesn't even have to be the FBI.

'BLACKMAIL CENTRAL'

A few weeks ago I lapsed into histrionics on these pages on the subject of our country's new Wiretap Access Law. At the time, I asked rhetorically what kind of Congress, judges, courts and journalists we could egpect if Bill Clinton's administration succeeded in legalizing this frightful, untraceable surveillance equipment. In my opinion, this equipment poses a clear danger of transforming federal law-enforcement agencies into Blackmail Central. Or worse. I wouldn't be the least surprised to learn it has happened already-after all, these devices were designed years ago and widely installed and tested in 1992, according to reports. So I ask again now, how will we shield congress, the courts and our citizens from politically motivated blackmail and retribution now that we tagpayers are paying for undetectable, automatic federal surveillance as the law of the land? Why, we'll have a contemptible, craven and silent bunch like we had this year, of course. When your senator comes around looking for your vote this fall, remember the "unanimous consent" that passed the Wiretap Access Bill. Why not ask him or her why they liked the bill, S. 2375, so much? If they don't remember why, ask them if Louis Freeh is as funny in person as he was at the A1 Smith dinner.

The Japanese version has a lot of holes including cellular. In the Japanes
scanner enthusiast publication, ACTION BAND, they posted a mod
to restore full coverage that involvedremoving a surface mount resistor.
Let me check to see if I can find my doc on it.

Source record: 266199

I'm looking in the November issue of Monitoring Times, and on page 8 is
a full-page ad for the ICOM R7100 for $1350 (far out of my price range).
Included with the product is a "GRE Super Converter", which they say sells
for $94, but is included free with this particular scanner. In the
picture it shows the converter mounted on top of the scanner, but my
guess is the purchaser must connect it. The converter looks like some
sort of block converter, to receive the whole 800 mhz band. I asked
before in this newsgroup whether converters where included in the
cellular ban, and it was assumed they were, unless they were some sort
of kit that the purchaser would have to put together themselves. In
which case the retailer could claim he just sold a sack of electronic
components, and it was the purchaser who made the converter.
But does anyone know where this device stands in regard to the
cellular capable ban???

>me the sections out of this Act that covers this?

>BTW, this is the same paper that complained about police officers that
>used scanners to gather info about drug dealers that used cordless
>phones.

Mark,

I was a newspaper editor for 20 years. I would never let a reporter quote radio traffic off the scanner. In fact, no information should be used without verifying it first.

As to the Comm Act of 1934, it does not prohibit the publication of comms heard. It DOES, however, prohibit the use of what ones hears on the airwaves for monetary gain. One might argue that the newspaper is a for-profit enterprise and it is making money off what it hears by publishing it. The law also states that one may not divulge to others what is heard. So you kind of have two violations there. However, in all honesty, I don't think you will see anything done about it unless the police themselves complain. Even then, I'm sure not much would come of it.

Not too many newspaper editors are aware of the Comm Act of 1934.

I tend to think the use of a repeater would be VERY uncommon!
Remember the previous post.. these radios only go a block or two...
I'd like to see a repeater shoot such a short distance. These are
just FM radios... low power units, nothing special. :-)

... Lawyers do it on a trial basis

I did use that antenna,but with a twist .I also purchased a window
mount,with two suction cups,wich has a BNC antenna connector at the top.I
just stuck it on the window in the living room and it worked great.I did
try to put it outside the window,but the antenna its not itended for
outdoor uses and it will corrode quite fast.

: The Homestead AFB in S.Florida is having an air show this weekend and
: I could use some frequencies or suggestions on what frequencies might
: be worth trying

Hey Mike. Guess my last post didn't work. It mentioned that I'm a newbie
to scanning. I'll add now that I'm a newbie to internet :(

Those caveats being said, try the following:

USAF Security (nationwide) = 413.450
USAF fire/crash (nationwide) = 173.5875
USAF Thunderbirds = 141.850, 322.950, 413.0, 413.025, 283.5, 322.6, 382.9

If the thunderbirds are going to be at the show, you might want to try their
freq's a day or so before the show. I've seen them many times in AZ and
NM and they usually fly in a day or so before and do a practice show.

Also, in case you haven't already done this, you might want to go to your
local radio shark i mean radio shack and pick up a copy of Police Call for
your region of the US. That's where I got these nationwide freq's, and
I'm gonna assume that your regional copy would have specific freq's for
Homestead AFB.

best,
aaron

Normally, they only scramble during sensitive tactical situations, such as a drug bust, etc. For obvious reasons, they would be very interested in why you'd want to rent time on a super computer and try to do real-time digitised audio decrypting. If they are also using spread spectrum radios as well as encrypting, it would be even tougher. I'd forget it if I were you.

kws@fc.hp.com (Karl Schultz) writes:
:
: If you have a favorite tight low frequency range, you might try building a
: 1/4 wave antenna for that frequency. Cut two wires (18-gauge is OK)
: and run them along the wall-ceiling joint in your apartment so that one
: end of each wire meets in a corner. Run coax from your radio to the corner
: and solder the ground to one wire and the center to the other. Each wire
: is 1/4 wavelength. May not be the best set-up in the world, but is very
: cheap and rather inconspicuous.

That would make the antenna horizontally polarized, which would lose you
around 20 dB (if I remember correctly) over a properly vertically polarized
antenna.

Yeah. I realized after I posted that my terminology was poor. I should have said encrypted, not scrambled. All the police encryption techniques I have run across are either digital encryption or spread spectrum. I have never heard frequency inversion used.

:
: You will not need a supercomputer, or anything even close to a 386. Once you
: know what is being done to the audio (the hard part) you only have to "undo"
: whatever it is every 100 microseconds (at the rate of 10 kHz for 5 kHz bandwidth
: audio). Right?

If it is encrypted - wrong. You have to know the key that is being used for the encryption, which is applied to every byte of the digital signal. You also have to know the particular encryption/decryption algorithm used.

Can anyone suggest what kind of mobile antenna would give the optimal performance on 460Mhz? I am only interested in this one band, I am not concerned about performance on the other bands. Any help would be apprciated, thanks.

>>>I asked before in this newsgroup whether converters where included in the cellular ban, and it was assumed they were, unless they were some sort of kit that the purchaser would have to put together themselves. But does anyone know where this device stands in regard to the cellular capable ban??? <<<

It is not assumed - it is fact. 47 CFR 15.121 (a) reads:

"...(S)canning receivers, and frequency converters designed or marketed for use with scanning receivers, must be incapable of operating (tuning), or readily being altered by the user to operate, within the frequency bands allocated to the Domestic Public Cellular Radio Telecommunications Service in Part 22 of this Chapter (cellular telephone bands). ..."

Armchair engineers and attorneys will likely flame this message, pointing out for example that the Domestic Public Cellular Radio Telecommunications Service is a term no longer used and that its current official name is the Cellular Radiotelephone Service (so have it your way) or that you can still buy converters, thus the law is invalid -- or other assorted hooey.

The FCC said that the Telephone Disclosure and Dispute Resolution Act (TDDRA) - the otherwise unrelated legislation to which the cellular industry attached this ban, parasite-like - left the FCC "no choice but to adopt" a ban on cellular freq converters as well as scanners. Like Dave Barry, "I am not making this up." (Report & Order, ET 93-1, FCC 93-201, April 22, 1993 at 11.)

Yes, I know Section 15.121 (b) allows scanners and converters that are "manufactured exclusively for, and marketed exclusively to," exempted entities (law enforcement, federal customers) to be sold. The average scanner monitor does not come under this category.

Like they say downtown - Yo, deal with it.

Yes this can work, on a limited basis for FM radios in the states.

I work for a radio station in Philadelphia at 100.3 If you have a scanner or amateur radio in your car tuned to 444.000, you will notice signals come and go as cars pass you by if they are listening to 1003. My radio in my car, however, does not emit the same signal. Some radios are better than others at blocking emmission of the if/frequency.

If your interested, 100.3+10.7 X 4 = 444.000.

Hi there:

I just got my hands on a uniden 560xlt 16 channel mobile unit.
If you are familiar with the unit (or most other small uniden
units) you know that the antenna connection is less than standard.
So the question is how do modify this non-standard antenna jack to
receive the BNC connector from my previously installed mobile antenna?
Or can I just get an adapter for it? None of the stores I've
called have a clue.

Thanks for the help.

later...

:)
Ok , I will try not to take that pesonally :). I was trying to keep the
explanation short and general. You are correct, the Motorola systems can
be reconfigured rather quickly especially Smartzone. And in regards to
Smartzone in particular, one systems configuration does not mean that the
next will be just like it. Smartzone does not have to be a statewide
system either, it could be local or county. They are typically more
suited for large area coverage, using multiple control channel
frequencies throughout the coverage area. Every site in the system does
not have or need to have the same frequencies either. The zone
controller will connect talkgroups together via whatever channel resource
it has. If for example talkgroup 002 has mobiles in 3 out of 5 site
coverage areas, the Zone Controller will only assign channels in the
three zones. So if you were monitoring one of the 2 zones that did not

have mobiles on talkgroup 002, you would not hear any of their (TG 002) conversation.
It would take a large book to descibe all the possible configurations available with Smartzone. Which is why I kept the first response short.
For the purpose of monitoring, do what you always do when monitoring a trunked system.
:)

Many of the IC chips used for FM detection have a pin for indicating
the signal level. Often, all you need to do is measure the current coming
out of the pin.

So, if you can look up the chip in a suitable data book, it shouldn't
be that difficult. The people who make celluar phones require this
feature--I'd expect even the newest chips to have it available. This
feature has been standard a long time--even early chips like the LM3089
have it.

From: fd@wwa.com
Message-ID: <39avit$5bh@sashimi.wwa.com>
Source record: 266102
Cross-posted to: alt.radio.scanner,rec.radio.scanner

If you have a modem that does voice processing... (I got one, 1.44 fax/data/
voice for $127)... you can program it to decode DTMF... in REAL TIME...

Give it the following commands:

AT#CLS=8
AT#VLS=1

Now, any audio coming in the phone (not the line jack) will have the DTMF
decoded and display in the comm program. Just punch the buttons on your
phone and see them. Wire in the audio from your scanner or tape recorder
and see those dtmfs... you probably want to go though an 8 ohm to 1k ohm
audio transformer... you might pick it up straight from the phone mouth-
piece as well.

>
>
> Thanks in advance
>
> Dave
>
> dretzik@uoguelph.ca

It's 11/3/94 and still no replies!? I think CTCSS is short for "control tone coded squelch system" which involves a transmission including a subaudible tone which allows the squelch/receiver to open only when it "hears" the subaudible tone. It is also known as a "PL" which is a trade mark/name which stood for "private line". Otherwise, any other transmission, on the same frequency, is ignored.

You might try calling one of the AMATEUR ELECTRONIC SUPPLY (AES)stores. The main store is:

AES
5710 W. Good Hope Road
Milwaukee, WI 53223 USA
414.358.0333
414.358.3337 FAX
800.558.0411 toll free

They seem to have two products which offer CTCSS "decode". The brand is COMMUNICATIONS SPECIALISTS and the model numbers are:

TS-32P ($57.95) or DTD-1 ($59.95).

I don't the differences between the two models or how they would be wired to a scanner. They come as a pre-assembled circuit board ready to "hard-wire" into a receiver (or transceiver).

Alternatively, but check me on this, I believe the ICOM R-1 scanner/receiver may have the option available (UT-50). If there's someone out there who really knows if the R-1 accepts a standard ICOM pl board, please let us know.

Other scanners known to have the option are:

UNIDEN BC760XLT option (BC025)*
890XLT (BC002A)*
8500XLT (BC005)*
(*refs. from the SCANNER WORLD catalog and their phone no. is: 518-436-9606)

Good luck.

: months from the date the order was placed with them.

: It's well worth the wait - seems to do everything better than ANY other
: scanner I have and these include an AOR AR3000 and a Yupiteru MVT7100.
: There are many more scan and programming options and it seems to be
: more sensitive than the Yupi on the supplied rubber duck antenna (I use
: an external amplified antenna on the AR3000 so cannot directly compare
: it although AM VHF reception at around 100MHz seems almost as good on
: the AR8000/rubber duck as the AR3000/amplified antenna). The audio
: quality is also better than both other receivers.

: Anybody else out there care to compare notes or advise on where to
: obtain the computer interface and software?

Funny but I find that the rubber antenna with the AR8000 is almost a
dummy load. I have a lot of other antennas that are better.

As for the quality of the radio, I don't agree. I think they are both
pretty good. The Yupi receives SSB signals much better (more sensitive
and clearer) than the AR8000. That is HF SSB signals.

Overall I think they are both fine radios with each one having some
strengths over the other.

4891. PD's violating rights by scrambling?

Newsgroup: rec.radio.scanner
Date: 1994-11-03 18:20:20 UTC
From: mike@shien.ist.csuohio.edu
Message-ID: <1994Nov3.182020.15661@news.csuohio.edu>
Source record: 266127

My brother, a scanner enthusiast, posed an interesting question.

We as citizens, have the legal right to sit in on court proceeding
to see what goes on. What if the people in the case suddenly decided
to start speaking in a language that was foreign to us? Would the
court be violating our right to understand, in English, what
is going on in the court room that day?

Thus:

We are legally allowed to listen (via scanner) to what's happening
over the air as police go about their daily business. If they
suddenly decide to scramble their transmissions, would the casual
listener then have any grounds for saying his rights are being
violated by being denied the opportunity to hear what the
police (as servants to the public) are doing?

It's obvious that the PD can transmit their traffic in any
fashion they see fit (simplex, repeater, trunked, scrambled, clear)
so from a common sense standpoint, the answer is "NO", you don't
have a legal leg to stand on.

But why?

I am sure this has been debated to death before.

Mike

Paul Cordingley says:
" Is there a usenet guru out there who can explain exactly how to
" start a reorganization of scanner-related newsgroups? Do we circulate
" a petition? Is there a body that approves new discussion groups? To whom do
" we address our views? Is there a voting process?

Take a wander over to the USENET group, news.groups
Frequently there is a posting titled, "Creation of new newsgroups".
It lists the procedures to be followed. Namely:
propose the name for the new group.
write the charter/purpose.
call for discussion in new.groups
a vote taker will be identified
call for votes. Must meet the following criteria:
must have at least 100 votes
must have 100 more Yea votes than Nay votes.
2/3 of all votes must be Yea.
if it passes, 2 weeks later the new group will be formed.

" PS: While I'm on my soapbox, my personal opinion of what to do is:
" Establish a new newsgroup limited to exchange of technical information -
" eg VHF/UHF radio theory, transmission line and antenna theory,
" monitoring techniques, information on how UHF/VHF systems work
" and how they are used. Discussion of *NEW* equipment and modifications would
" be acceptable, as would listing of *NEW* or topical frequencies....
" but those seeking well-documented information on freq's, mod's
" or 'old' equipment would be politely referred to FAQ's or FTP sites.
" The existing alt. and rec. scanner groups would remain for far-reaching
" discourse on other topics just as they are used now.

A lot of the topics you've identified already exists in the various rec.ham
groups or here. One of the real problems is that when people place
followup posts that diverge from the original thread, they don't fork the
thread. Instead, they just keep it running with the same topic rather than
renaming the subject. Consequently we get one thread that starts with
something like "S meter mod doesn't work on PRO-2006". Later someone else
takes the opportunity to bash RS gear and doesn't change the subject
name. Later others respond to the `bashing' thread and the discussion
wanders WAY off topic.

This has become a problem when newer net users join enmasse and jump in
on discussions without having the benefit of experience with the group.
Much of the complaints about duplicate postings to alt/rec.scanners
(as well as the one's you've mentioned) could be eleminated or greatly
reduced if alt/rec.radio.scanners had a comprehensive FAQ to offer

guidelines as to how the group has been functioning, why the different groups, what is appropriate for each group, when to fork threads, proper attire/weapons/salves for flame wars, etc.

I too, disagree that we need more than the two groups dedicated to monitoring. What we *do* need is a bit more disclipine in the use of the groups. Many of the (valid) criticisms of the users of the two groups could be corrected with an informative FAQ.

4893. Cordless Scanner Law Is Banned

Newsgroup: rec.radio.scanner
Date: 1994-11-03 18:41:30 UTC
From: kjn@netcom.com
Message-ID: <kjnCypFx6.I6v@netcom.com>
Source record: 266118

Was: "Cordless Scanner Ban Is Law"

Sorry, but I couldn't resist when I misread the other subject header.
Wouldn't *that* make a great headline though... in this age of greater
restrictions upon the general public? !!

How refreshing it would be to have some government agency reaffirm the
responsibility of the users of convenience technology instead of upon
everyone else! But nooooo... our esteemed legislators constantly pursue
simplistic, attention getting, methods to make it _seem_ that they solved a
problem when, in fact, they have done nothing but erode some of the rights
of the public at large.

If they wanted to REALLY protect the privacy of individuals using
cordless/cellular technology then require the *manufacturers* of the
equipment to install sophisticated encryption devices on every phone.

The problem is that they really don't want to solve the privacy issue at
all. They give the appearance of *privacy protection* without incurring the
warth of the money boys in "Big Business". If REAL privacy were available
the DOJ (Dept. of Justice) might want a univeral key (read Clipper Chip)
to allow _them_ access if they want to listen in...

Naw... that'd never happen.
Would it?

Regards;

"Why would anyone want to monitor fast food drive through
> frequencies? I can't imagine the conversations being that
> interesting."

Given the fact that the average IQ of a fast food drive-thru order taker is about 36, it might be nice to be able to hear the moron screw up your order so that you can correct it when you get to the pick up window. This would shorten the time it takes to double check the order before you drive away, therefore making the line go faster for everyone. Hows that for a reason? I haven't done this, but its lunch time and I am speculating.

By the way, of course not every fast food employee is an idiot, it just seems that way.<g>

I am looking for information on the Uniden MR8100A Scanner. I have recently purchased this scanner and like it because of the alphanumerics. It does cover 800 mghtx but only holds 100 channels and must be programed for alphanumerics by hooking it up to computers serial port. Has anyone attempted to modify this scanner to have the ability to search up and down frequencies? If anyone has information on mods for this scanner please Email me. Also what s stores are selling these and what is the going street price on these?

Thanks.

Today in the mail I got an add for software for the optoscan 456. It is called probe and is suspose to be out of this world!! Does any one have any experience with it or know iif it will do a better jop than scan star 3.44 ??

What I read sounds good but you hate to spend money on somthing you no nothing about. It sells for 99.95 and if you order it now you save $20.00.

Send me any notes about software for the opto, I've tried radio manager in windows good program but real slow and slows down your other applications.

tnx Jim VE3TEJ jthomas@hoookup.net

> Pete Womack.
>
This is not some sort of expensive jamming signal. First of all, the FCC would never allow such a device for such purposes.

More than likely, as you passed the car the officer happened to transmit. Anytime your right next to a transmitter like that (probably 100 watts or more), it's going to blow your radio away--front end overload on the receiver. If the receiver is of poor quality, and this continued long enough, it could damage the receiver.

And no, there is no mod to get rid of it other than a handy power switch to turn it off. There are some other factors involved, it isn't quite that simple. There are some things that can be done to reduce the effect (i.e.--adjacent channel rejection, etc.) if the receiver is "over sensitive" to this type of problem. But when you are right next to a transmitter of that power, there's no way to avoid it. Even commercial grade receivers have this problem to some extent.

Have you ever heard an officer notify his/her dispatcher that he/she just set off a car alarm? This is why. The transmitter was keyed up right next to the car. Like I said, it's not quite as simple as that.

[Pardon me for a minute while I put on my asbestos underwear]

As much as I enjoy listening to the local police on my scanners, to the point that I have 6 scanners last time I counted, my first response to your message is this.

I know it is not against the law (yet) to listen to police (or just about any other public service agency). But I have yet to see a law (and I try to stay pretty well informed on this topic) that guarentees me the right to do so. The Constitution doesn't mention radio reception, nor does the Bill of Rights, and I don't recall seeing it in any of the other amendments either. I also have yet to see any law which says that the police (or any other agency for that matter) must perform their transmissions such that I can easily hear them. In fact, the only mention I see of it in the copies of the laws I have is an occassional brief mention that the law in question does not apply to the monitoring of public service frequencies. Again, this is not stating that I have a God-given right to do so, it is only stating that it is not illegal (yet) to do so.

So yes, your statment at the end of the above quote is correct, no, you wouldn't have a leg to stand on using that as an argument.

> But why?

Because there is no law which guarentees you the right to listen to police radio transmissions. And before 20 people send me mail or post responses

saying "oh yes there is", you might as well go on and get ready for me to ask you to send me a copy of that law, or the necessary citations that I can go look it up for myself.

> I am sure this has been debated to death before.

Yeah, but what the hell, its a slow night ;-)

Oh yeah, I have a question. And this is a serious question, not rhetoric, and I truthfully want to know...

Is there a law that requires court proceedings to be in english, or a language that the spectators can understand? I always just assumed that court proceedings only had to be made understandable to the defendent involved.

[Insert my usual block of comments about how I'm not a lawyer and none of this is legal advise here...And could someone please invent asbestos shorts that are not so darned scratchy!]

Best bet for actually hearing the President when he's in town
would be tuning to 154.57 (or 154.60) & 35.020MHz, NBFM.

Body handling: HTML body converted to readable text

I am a local security officer and always carry a scanner on my person
while on duty. I am also friendly with several PD officers and they
have no prblem with it.....I should be aware of what's going on in my
immediate area.
So I have heard the argument if an induvidual "conceals"
a transmission then they have something to hide.
Why would this arguement not also apply to the PD...do not use the
"covert ops" excuse because I have heard plenty SWAT and Warrent
Sservices on the air and cannot figure out where they are by the
terminology used. and I grew
up here and am very familiar with the area.
How many crimminals actually monitor LE and can gain anything from it?
People overhearing my scanner have no idea what the calls mean.

4917. hooper swans on the air?

Just listening to the "Wild Life" program here on radio 4, and there is
a discussion of Hooper Swan migrations over Scottland.
I just wonder what frequency they are using for tracking these birds.
Was only listening, but I thought they had been fitted (some of them)
with transmitters.
Even at low power, these should be audible for some miles.
This would go for any bird tracking by radio, I wonder where these
things are liable to hang out.

Well I just finish reading that the pro43 cell mod is being done for $40 then I read another guy is willing to do the mod for $35, So I figured I'll come in and underbid all of them and would do it for $25. I've done the mod many times for my friends and I'll say my return time will be 2 days! Anyone need the cell mod done on there pro43?

You know what else kills me? I saw a post for the cell mod for the 2006 for $20. I could do about 100 2006s in 1 hour so thats 100@ 20 or $2000 / hr Shewwey .... Somebody is crazy!

If you need me to do the pro43 mod mail me with questions.

I'm thinking about trying to find a scanner to mount in my car.
Are there any out there that will pick up military aircraft?
I know the PRO-43 will, as I had one for a month or so (until
I got the bill and couldn't afford it). I found that I mostly
listened in my car, so I am more likely to buy one that I can
mount in the car. If anyone has any information about such a
rig, or has one that they are trying to sell, PLEASE email me.

Thanks,
Andy Entrekin

Richard Crisp (crisp@netcom.com) wrote about my mentioning CSG:

: for your $40 they will smash the diode that needs to be removed and then
: not re-solder it to the proper place to enable the low band
: VHF, you will not get the low band.

You are correct. They do not move the diode. But there have been reports that this mod is ineffective because the unit is not optimized for reception in this range. As I understand it, they don't want to move the diode, even for an extra charge, because they don't want to deal with people who are unhappy with the result through no fault of CSG's. And, yes, it's a lot easier to snip than snip and resolder.

: Bottom line here folks is that these guys are making a bunch of money`
: off people's ignorance.

But if you don't have the tools or the skills, $40 may seem an attractive alternative. So, it may not be an issue of ignorance, but one of convenience. Also, in a world where RS pulls its stock of *legal* scanners for fear of having Big Brother at the door, can anyone name any other company that *advertises* that they'll modify scanners? I'd have thought that you'd at least (grudgingly?) given them a point or two for being willing to advertist their services and make them available to people who might otherwise be unable to get their units modified. :-)

BTW, I've visited their shop and when I was there, they showed someone having a 43 modified how to do the 2006 mod themselves.

: If anyone wants it done locally in teh SF Bay Area, the correct way, contact
: 'me and I'll do it for $35. It will also receive the VHF low band
: which you will not get if the CSG guys do it, and you will pay for postage
: to them as well as more money for less product. You will also wait
: longer to get it back.

But you've got no advertising costs. Would you still do it for $35 if you were running regular ads in MT, PC, and who knows where else? As for turn around, that's a function of the common carriers. In MA, sent on Monday means returned by Wednesday.

Summary: Richard is correct about the partial mod and it would be nice if they'd do it for customers who acknowledge the 43's limitations in the low range. But there's no misrepresentation (they offer *only* restoration of cellular frequencies) and the unit comes back with cell frequencies enabled.

Similar comments can be made about Richard's [snipped] comments regarding their antennas. I'm surprised that they wouldn't let you try the

antennas (that wasn't my experience at their shop) but I wasn't there and
don't know about the RF levels and size of the crowd.
I believe that anyone with the technical skills could probably build
a functional equivalent for 1/3 the price, but again there's the issue of
knowledge, parts, and time.

> demilitarize the USA!

At the risk of continuing a thread inappropriate to this
newsgroup.....

I can't vouch for the question's wording as posted here, but I read
that the question was outlining a clearly illegal and unconstitutional
act to gauge soldiers' knowledge of their duty to refuse to obey
illegal orders. The proper response would have been "strongly
disagree" - they were not looking for soldiers who would agree with
that statement. The premise of the last sentence in the paragraph
above is bogus - Ayoob may have been informed of that, but it was
likely from someone who didn't know what the hell he was talking
about.

This (and the bit about training foreign soldiers in Michigan) is a
clever manipulation of facts laced with unfounded rumor in an attempt
to whip up some hysteria about the UN taking over the US. Using
"GUNS" magazine (the original source) as an authority on this sort of
thing is sort of like quoting Greenpeace publications on nuclear
power.

The new R-100 are no longer capable of receiving in that area. They were sold
continuous coverage, no mods were required. You only hope is to use a
converter module like the GRE Super Converter I or II to convert the 800-900
range to 400-500Mhz.

You may want to try the Radio Shack multipurpose soft scanner case that
sells for $9.95. I got one, it has the speaker grill perforations and offers
a nice buffer against small drops and fall-overs.

>likely to ever need for SW.
>

I have upgraded the hard disk twice in my Toshiba T2000SX (16mhz 386sx)
I had to hack the ROM bios to get the proper drive parameters into the
drive table in the ROM, but it works.

>I guess one thing to consider is whether the controlling software wants
>a color screen, mouse pointing, Windows environment, etc. I was hoping
>there'd be some simple software that was keyboard oriented available
>as freeware or shareware, or for a low cost. Note I still haven't
>picked the receiver to be controlled -- I'm just blue-skying the whole
>concept right now.
>

Well the NRD program Tom WHiteside wrote and distributes for free works
great on my T2000SX and I don;t get RFI from it. It does not require
Windows althougth the T2000SX will support windows. I also know that
a good friend and associate, Tom Roach, has become a believer in
laptops such as this after having lots of RFI problems from his
tower box, and seeing them go away cleanly using a laptop.

Most of the Laptops made after 1990 use IDE for the disk interface.
If you get one with a 20MB disk, chances are very good that you can
replace the 2.5" drive with a bigger one. As I said you may have to hack
the BIOS to modify the drive table, but that is an easy task if you
have access to an EPROM programmer.

Also if anyone wants it, I have a used 2.5" IDE drive of 60MB capacity
(it is a seagate) that I no longer need. I originally replaced the 20MB
in the Toshiba with the 60MB seagate but now have moved up to a 256MB
drive in the machine, so the 60MB is sitting free and easy now.

I found that the freuency lists, the data base software, windows and
a few other things pushed me well beyond the 20MB range. So after
a bit of hacking figured out where the drive table was and changed it.

The 60MB drive is $75 if you are interested and I can supply the bios hacking information so that you can change your own if necessary.

>But are such earlier-generation laptops likely to put out so much RFI
>that they are bad for this particular dedicated use? Are some brands OK
>and some lousy? Can anyone give any specific pointers to good ones
>or bad ones in this area? What about modifications to reduce RFI,

Another friend is using older generation Zenith laptops in his radio room (two of them total) and is having no RFI problems.
I say they are a good way to go.

>I believe that anyone with the technical skills could probably build
>a functional equivalent for 1/3 the price, but again there's the issue of
>knowledge, parts, and time.

The reason they would not allow me to try out their antennas was that they were at the MT convention, had a table set up, had a crowd of lookers hanging around and had a person asking tough questions that might tend to expose the fact that the antennas were as effective as the whip antennas which are provided with the scanners.

If you were in their shop, it is not like 15 people would see that the whip antenna they already have was effective and the snappy looking thing they were trying to seell worked no better. It is pretty simple, if someone is exposing your product as being more look than function, you want to neutralize them as quickly as possible.

I walked away chuckling about the whole episode. It is pretty much the sort of show the MT convention was from my perspective. I still can't believe LVH told us that MFJ means "Mighty Fine Junk" and that he told us to not plut our antenna into the wall power socket!

I think Greenpeace may in fact be a credible source, regarding Nuclear Power. Just because someone is publishing a journal that appeals to a special interest group doesn;t mean the information contained within is any less accurate.

For example, how about your monthly editorial Bob Grove writes in MT? When he talks about scanner banning laws, it doesn't mean he is in error. WHen I have read his editorials, they seem to be fair and factual to me.

try the pro-2026! it is on sale for 149.00 and can be modded in literally 2 minutes. It has 100 channels, and 5 band searches. Good deal.

>Why would this arguement not also apply to the PD...do not use the
>"covert ops" excuse because I have heard plenty SWAT and Warrent
>Sservices on the air and cannot figure out where they are by the
>terminology used. and I grew
>up here and am very familiar with the area.

Yes, it would indicate that the cops had something to hide...

Like a stakeout of a group known to monitor scanners.
Like the followup to a downed officer, where it is known that the
officer's spouse monitors the scanner and the desire to inform the
spouse in person is preferred to him/her hearing it over the air.
Like tactical information for a known celebrity's visit.
etc etc etc.

I *DID* include "covert ops" here because it *is* possible for an
uninformed listener to fiqure things out if one listens long enough.
I myself have heard a covert operation... and had confirmed where it
was happening the first night just by comparing certain observations...
such as "Car coming down the hill" and "backed up to the door with the
trunk open" and other seemingly inert comments. It wasn't till the third
day, that I realized that these covert ops were not cops, but rather crooks.

>How many crimminals actually monitor LE and can gain anything from it?

I know of Two... and although they thought that their use of a scanner
would help them keep track of the local cops, their use of a itinerant
two way radio and their thinking no-one listens to 154.6, got them caught.

>People overhearing my scanner have no idea what the calls mean.

When one overhears a scanner carried by a third party, it is likely that
the person has not been following the entire series of communications.
The question is, when YOU hear a call on your scanner, do you understand
what it is about? If so, and if you had not received any other input from
the police other than via the scanner, you would have to assume that it is
possible that anyone else experienced in monitoring freqs would also be able
to fiqure it out.

BTW: I am NOT for the scrambling of routine police traffic, I'm just
pointing out where it might be beneficial in some cases.

>wants to tell me. The shop I bought iy from, C. Crane in Fortuna CA,
>said to call them after I have had it 30 days and they could help.
>I'm just wondering if I can do it myself. Thanks, Rick.

My response:
The whole change is completed with the moving 1 chip(a surface mount
resistor) to a different socket. I would not suggest doing it yourself
unless you've had prior experince with this sort of thing. I know for a
fact that some of the original drawings out there for the 855 are
incorrect in the changing of this chip. I was told that by moving the chip
to the wrong area of the two areas available could damage the unit. Please
let someone do it for you if your not familar with it.
Good Luck

>some static charge or signal overload which may somehow wreck it, or
>hurt its sensitivity. Any suggestions on my fear here, and whether I
>should attach any resistor to where my wire antenna is clipped to the
>whip antenna, to protect the receiver's circuitry?

Zack Lau of the ARRL (US amateur radio's national organization)
suggests placing a 1000 ohm resistor between the antenna and
ground terminals to bleed off any electrostatic charge; if you
detect any loss of sensitivity then try a larger value resistor,
say 10,000 ohm.

From: pwd@apple.com
Message-ID: <pwd-041194132823@17.130.21.52>
Source record: 265321

I don't mean to prolong this re-appearance of the infamous "Fast Food Frequency" thread but this came up a while ago and I've compiled a listing of all frequencies I've seen posted into the following document. Hope this helps; have a listen and decide for yourself how long you can stand it.

The listing can be read horizontally to see who's on a particular frequency or vertically for some of the major chains to see which frequencies they've used elsewhere.

This list was compiled from numerous posts on the Internet news groups alt.scanner and rec.scanner from many posters, among them:

Brad Steinman (cscon0151@uoft02.utoledo.edu, 131.183.1.4),
mcneill@salem.enet.dec.com,
Bob Parnass (parnass@ihlpm.att.com),
stretch1@aol.com.

Thanks for sharing the information!

Warning: unfortunately some of the postings confused CTSS tone frequencies (in Hz or KHz?) with carrier frequencies in MHz, so some of the listings below are unreliable. Scan the bands yourself and see what's around locally.

Have fun,
-Patrick Penzias Dirks.

-=> Quoting rich shaw to All <=-

rs> Hi all,
rs>
rs> Couldn't find any info on this from the mangaizes.
rs>
rs> Is there any other hand-held scanner except pro-43 triple conversion?

Hi, Rich...
There are several...some are out now, others are coming. The '43 is the most popular triple conversion. It is on the discontinuation list at Radio Shack and may no longer be available soon.

The Pro-62 is the latest triple conversion handheld that is out. Picks up the same as the '43 except for the military air band in the 200 to 400 Mhz range.

The Bearcat Uniden 2500 is triple conversion, though the unit can still pick up images, which most users don't want. Picks up about the same as the '43, with the additon of the Citizens Band. This unit is about to be disconinued. (if not already.)

An upcoming Pro 60, due out in Feb. 95 is the replacement for the '43. Details of this unit are still leaking out, but should be the same as the '62 with military air included.

The '62 has gotten favorable reviews so far on CompuServe.

The Uniden Bearcat 3000 handheld should be out in Dec. 94. Will have some extra features that the 2500 didn't have, and some removed.

Jerry

4943. RS scanners modifiable for military air freqs?

Newsgroup: rec.radio.scanner
Date: 1994-11-04 21:50:08 UTC
From: gt8303a@prism.gatech.edu
Message-ID: <39eaag$nu@acmey.gatech.edu>
Source record: 266173
Cross-posted to: rec.radio.scanner,rec.radio.swap

It's me again. Someone suggested I look in to the PRO-2026, and thought it might be modifiable to receive military aircraft. Is this true? If so, what does the mod involve? If not, are there any scanners out there that are reasonably priced, but can be modified to get military air frequencies? I've seen a gadget from Grove that allows less-fancy scanners to do this, but it costs around $100, money that I'd just as soon save for other uses later on. Thanks.

Andy

> are the civil liberty types rolling over for them?

[Let's see if I can figure out a way to respond to this without marking myself as major flame-bait...]

Someone correct me if I'm wrong (and I'm sure atleast 30 people will), but in every interpretation I've ever seen of the 1st amendment, while the amendment gives you the right to free speech, it does not give you the right to do it anywhere you darned well please, nor does it require that anyone go massively out of their way to provide you with a place to do it.

I realize this is a controversial subject, so I'm already bracing myself. If someone has seen something that would make my opinion wrong, I'd like to hear about it. If all you're going to do is flame, don't waste your time or your keystrokes...

In a previous article, alacy@skew.com (skew) says:

>try the pro-2026! it is on sale for 149.00 and can be modded in literally 2
>minutes. It has 100 channels, and 5 band searches. Good deal.

Wrong answer... note that the original poster wanted to monitor mil a/c
The Pro-2026 does not cover 225-400 Mhz AM band!!! Unless you wish to
spend another $100.00 on a Grove CVR4 Scanverter. As far as I know you'll
have to either buy a used Pro-2004/5/6 or an AOR unit with the band you
want to hear.

Take a listen sometime. It's not the ordering that can be interesting listening. It's the 'behind the scenes' stuff. Yes, you can catch up on who is hot and who is not in the local high school. Hear what they are saying about some of the customers.

The radios they use double as an internal communications system. For example, I heard at the local BK how hard a new worker was cleaning the windows. Boy, was she impressed and wanted to know if he would come over and do her windows.

From: ROSS@NOVAX.LLNL.GOV
Message-ID: <ROSS-041194171546@lisaraip7.llnl.gov>
Source record: 266084

Question:

The owners manual for the ATT 9120 900 Mhz cordless phone states "the 9120 scrambles you voice before it transmits it." Are they blowing smoke or do they consider digitizing to be scrambling?

Since the phone has 10 channels, if there were eleven 9120's phones used near each other, would one of the phones be able to hear anothers call 'in the clear'?

Thanks,
Gary

What I'm saying is your "forced" to buy this way, with slick-talking
salesmen ready to take you to the cleaners. How would you feel if
EVERY grocery store in town did the same thing. Saying you're obligated
to buy such and such every month, and if you don't, you must pay them
a $1000 dollars. You absolutely couldn't comparison shop anymore, and
stores wouldn't have to advertise as much, or have sales, since their
customers are stuck buying from them, or they will starve. But if
you really knew all the crap and lies cellular retailers do in
California, in ripping off the public, then you would understand why
they have this law, even though the enforcement of it I see as quite lax.
It has nothing to do with free enterprise, but with consumer protection.

From: schuster@panix.com
Message-ID: <39eqdf$9rg@panix3.panix.com>
Source record: 266110

Wow, are heads going to roll.
Special thanks to CompuServe Hamnet member Howard Bornstein, and sysop
Jeff Goldman, for publishing this and for permission to re-post:

**********begin quoted text**********8

Here we go again!

A couple of months ago, Radio Shack, under orders by the FCC, pulled from their shelves, all stock of PRO-51s, PRO-23s, and PRO-46 scanners. These scanners are made for Radio Shack by Uniden Corporation. Apparently the reason for this drastic action was that these scanners had a special mode that loaded "test" frequencies into the channels -- a mode which was available by a special keyboard combination. One of the test frequencies fell within the cellular base band.

Because these scanners were made for Radio Shack, they all included Radio Shacks "direct search" feature. This feature allows one to search up or down from any frequency loaded in a scan channel. This feature, combined with the test frequency allows a user to directly search within the cellular range.

What is particularly puzzling here is that all of these scanners can receive cellular images at 21.6 Mhz above the fundamental frequency. These images are as clear as the original broadcast. So to pull the units because they can be "tricked" into searching cellular directly seems odd at best.

In any case, new PRO-51s have recently been appearing in Radio Shack stores. These units have been "modified" to eliminate the offending test mode. Now, when you try test mode 1 (as described in the document PRO51.TST in the Scanning Library), instead you get the frequencies in test mode 2. There are no out-of-band frequencies in test mode 2, so this mode is generally considered useless to scanner listeners.

Apparently, Uniden did not put much care in their "modification" as it is still possible to load the PRO-51 with the useful test mode 1 frequencies, even in the "new" PRO-51s.

First, hold down BAND, 2 and 9 while turning On the scanner. (You'll see all the features of the display window repeatedly lighting up from left to right.)

Then, while that's happening, hold down L/O, 2 and 9. Within a second or so the scanner start scanning. The freqs it'll be scanning are the original Test Modes ones (including the ones that give you both European midband and US cellular).

ATTENTION JERRY SMITH or MIKE SCHUSTER: Feel free to post the above on the Internet, but please give credit to the CompuServe HamNet Forum. Thanks!

- Jeff, Sysop

PS Thanx to Grove Enterprises/Monitoring Times for the above info.

Joe Cacciatore (jocatch@vnet.ibm.com) wrote:
> I can pick up my local TV chan 54 on my IC 2SRA on 921.66 mhz
but I can not pick it up on my BC 8500 or Pro 2022 on 921.66.
I assume the Icom (a 2 meter HAM HT and scanner) is cheaper than
the base units. I would like to program chan 54 directly into my
8500 but don't know the freq. Anyone know what the audio freq of 54 is?

UHF Channel 54 audio is at 715.75 Mhz (WFM). If you're getting it
somewhere else, you're either receiving it as an image, or possibly
a studio-to-transmitter link. Scanner guides often have these frequencies
listed. I know for a fact these frequencies are listed in Police Call,
since this is where I looked this up for you, which you can get at
Radio Shack.

4963. RS-2006 Touch Tone Decoder Needed

Don Ritchie K8ZGW says:
" Will SOMEONE please help me understand just why in the
" world ANYONE would want to listen to a fast food drive thru.

I plug in a few of the more common freqs so that when I'm on the hwy and
getting hungry, I can punch the bank with the FFR (fast food rest...) and
can see what's coming up in the next mile of so.

Also while waiting in line for the drive up, you can hear some of the
service people inside as they use the things for intercoms and say some really
stupid things. I wouldn't want to make a hobby of listing to FFRs but for
the few minutes I'm trapped in line it can be an interesting diversion.

BTW, I *do* have a life... :)

From: kjn@netcom.com
Message-ID: <kjnCys5AJ.CA6@netcom.com>
Source record: 266093

Jim Wayda says:
" I have two RS PRO-43 scanners. I cannot receive the CHP mobiles unless they
" are only several miles away. I receive the base stations with no problem. I
" have all of the mobile and base freq's programmed into my scanner. Is it
" not possible to receive the CHP mobiles using just the rubber duck antenna?

That's not too uncommon a situtation, Jim. Even though the antennas are
"loaded" to the correct wavelength, the capture area is quite small. By
sticking on one of the telescoping antennas (like 2 meter 5/8 wave) the
capture area of the antenna is greatly increased and you'll notice
significantly increased reception. The downside is the several feet of
chrome sticking off the top of the radio... not the best feature on a
handheld radio...

regards;

You are a blind person driving your car into the drive-up at McDonald's.
You have your scanner to listen in so you can hear what they serve,
since you can't read the menu.
You see, it's rather simple. But please tell me in advance where this
blind driver is driving next, so I can get out of the way. :)

---Sort of reminds me why at Wells Fargo Bank they have braille
instructions at many of their drive-up ATMs.

Source record: 265884

Ed Lieser # iccgcc.cs.hh.ab.com@242:4900/99.0 had a question concerning
"time via radio" on 28th of Oktober 1994

lichac> Recently I saw an ad in the British "short wave" magazine for
lichac> a clock controlled by radio signals labelled "DCF77" and "MSF".
lichac> Can anyone tell me where the transmitters are located and at
lichac> what frequency they transmit?

Hallo, Ed,
as far as I know, the DCF77-signal is broadcast from the Technical
University Braunschweig (Germany). They have an atomic clock installed
there.
The frequency is round about 77 kHz.(Yes kHz, not Mhz) Therefore a
reception of the signals with a radio-controlled clock is possible in the
whole of Europe as far as I know.

Please let me know, whether you have received this message since I have
never sent a mail on REC.RADIO.SCANNER. Thanks!

Bye, Wolfram

4985. help needed with BC250

Newsgroup: rec.radio.scanner
Date: 1994-11-05 22:54:00 UTC
From: hirschj@vax2.concordia.ca
Message-ID: <5NOV199417541607@vax2.concordia.ca>
Source record: 266038

Help, my BC250 just died. It was working fine scanning between
35 MHz and 49 MHz when the display started flashing at around
48 MHz and a loud noise came from the speaker in sync with the
flashing of the display. Suddenly it started working fine again.
A while later it did it again, but this time the incident ended
with the display going dead. It now has a permanent intermittent
problem: turning the unit on and off sometomes results in a blank
screen in the on state but the clock resets and displays in the off
mode; other times the display is blank except for one or several
dots in the on state while it is blank in the on position.
Sometimes in the on position their is white noise from the
speaker, other times there is nothing. Does anyone have any ideas?

4986. Pro-2006 Lamps?

Newsgroup: rec.radio.scanner
Date: 1994-11-06 00:18:58 UTC
From: bartdoug@acusd.edu
Message-ID: <CytKvn.9t9@pwa.acusd.edu>
Source record: 266039

Posted this once, but never saw it so I thought I'd try again.

Since the 2006 has been discontinued I though I'd call my local Radio Shack to see how much replacement bulbs for it would cost. I was told that you had to replace an entire board, and that the cost is $80. This does not sound right to me, so I thought I'd ask if anyone here has had experience changing the display lamp in a 2006.

Mine is brand new, but the manual says that the lamps can burn out, so use it sparingly. Any truth to this? How long do they last? Are there cheap replacement parts available? Any help is welcome, thanks in advance for posted replies.

With a good external scanner, you can only pick mobile units RELIABLY at
about 10-15 miles. With a rubber ducky... I would only expect about 5 miles.

Okay, simple enough question- here goes...

I understand (basically) the differences between NBFM, WFM, CW, AM, SSB, etc.
However, I do not have any idea where each type is used on the frequency
spectrum. Could a knowledgeable someone please explain 'who' uses
which type of modulation? I am particularly interested in which
type of modulation typical police, fire, pub. service use; however,
a complete listing would be even more helpful...

Thanks in advance!
Eric

$80.00 sounds like an awfully lot. The display in the PRO-2006, I think
is called an electro-luminescent display. You have a pretty blue
display, but I heard the half-life of it might be as low as 500 hours,
and will gradually get dimmer. If you want your display to last a long
time, I would suggest turning it off the light when you don't need it.
Maybe you could invest in some small light you can place right in
front of your scanner, to illuminate the whole front panel, and display,
to decrease your usage of the light. Anyway, below is a response I
saved from last time this subject was brought up:

From: mulligan@ACM.ORG (F. Barry Mulligan)
Newsgroups: rec.radio.scanner
Subject: Re: RS-2006 Scanner - Luminescent display.
Date: 4 Oct 1994 21:22:59 GMT
Organization: ACM Network Services
Lines: 27
Message-ID: <36sh3j$5nn@hopper.acm.org>
Reply-To: mulligan@ACM.ORG

Berton Corson> ... life span of the back-light on the RS-2006.
Reported experience has been 2 to 4 years, depending on usage, eyesight
and tolerance. It's amazing how much difference a new one makes.

Slow Bob> ... how hard is it to replace ...
Only two simple solder points, but a moderate amount of disassembly.
>From memory: remove bottom & top (note speaker wires); disconnect front
panel (unplug / unscrew wires top & bottom); remove front panel; remove
logic board from front; unsolder two leads to the ELP; remove dab of glue;
slide ELP out of display assembly; insert new ELP; re-assemble.
Note that disconnecting CN3 (15 wire cable) pulls battery voltage from

the logic board and memory may be lost. Record all programmed channels before starting or leave CN3 connected and try to work around it.

Slow Bob> ... Do you have to replace the whole lcd panel or what?
The ELP (electroluminescent panel) slides out of the sandwich that makes up the LCD display. It can be ordered for $11.50 from:
Tandy National Parts (800) 442-2425

Give them the catalog nbr of the radio (20-145) and ask for:
Ref.No Mfr's Part No. Tandy Part No.
EL501 Electroluminescent GE-88D-7738 LB-0040

You might want to order the tech manual ($6-8) at the same time, if only for the exploded view.

> Thanks in advance!
> Eric

Some general examples:

AM: shortwave, AM radio (of course), aeronautical communications,
CB radio
WFM: FM radio (87 - 108 mhz), Television, some military
NFM: Most two-way radio, some HAM, police, fire, public safety,
cellular telephones, a bunch more. This is probably the
most common mode you'll have set while scanning.
SSB: CB, some shortwave, some amateur radio, etc.

A general guide where frequencies are located is below:

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a
scanner or shortwave radio. Just be aware, having the right frequency
may not be enough, in tuning to a certain frequency. The time of
day, atmospheric conditions, location, mode you're in (AM, SSB,
Narrowband FM, Wideband FM, etc.), and your equipment, are also equally
important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), aeronautical communications (mostly AM),
and some military VHF/UHF (Wideband FM). Most all scanners will pick a
default mode for you, depending on what frequency band you are in. But
many scanners also let you manually switch between modes (AM, FM, etc.)
and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes
are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- --

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75

Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government,
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry,
military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, de-pending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

: > violated by being denied the opportunity to hear what the
: > police (as servants to the public) are doing?

David Michael Moore (davidm@iglou.com) wrote:

: I know it is not against the law (yet) to listen to police (or just about any
: other public service agency). But I have yet to see a law (and I try to stay
: pretty well informed on this topic) that guarentees me the right to do so.
: The Constitution doesn't mention radio reception, nor does the Bill of Rights,
: and I don't recall seeing it in any of the other amendments either. I also
: have yet to see any law which says that the police (or any other agency for
: that matter) must perform their transmissions such that I can easily hear them.
: In fact, the only mention I see of it in the copies of the laws I have is an
: occassional brief mention that the law in question does not apply to the
: monitoring of public service frequencies. Again, this is not stating that I
: have a God-given right to do so, it is only stating that it is not illegal
: (yet) to do so.

The only right we have as radio listeners is made in the Comm act of
1934... We can listen to any transmission upon the public airwaves,
various amendments have made certain broadcasts extempt to this rule,
i.e. scrambled or encrypted traffic can't be unscrambled, STL or remote
links for Radio or T.V. Stations, Cellular phones, (and now possiblly
cordless), and a few others that a lawyer could mention probably.
This does not give us the right to hear what anyone is talking about on
the airwaves, only to right to listen to the airwaves, if they broadcast
some type of encrypted noise, then we can listen to that noise, but not
the conversation that that noise is hiding.

: Is there a law that requires court proceedings to be in english, or a language
: that the spectators can understand? I always just assumed that court
: proceedings only had to be made understandable to the defendent involved.

That is a good question, and I'd say the law is just as you stated, It
only must be understandable to the defendant... not to the public. There
have been many cases where charges against people have been dropped, even
though the evidence proved they were guilty, just because the person

didn't understand English, and their rights were only giving to them in
English. Again it comes back just like the comm. law, we have the right
to hear what is in the room, not the right to understand it...

: [Insert my usual block of comments about how I'm not a lawyer and none of this
: is legal advise here...And could someone please invent asbestos shorts that are
: not so darned scratchy!]
ditto the usual disclaimer.

I do not know the freq for the datburst but if you want to put audio out
from a phone line into a line level input, it's very simple...

get a 600ohm isolation audio xformer (rat shack cat# 273-1374) and a .47
UF capasitor... place the .47 uf cap in series with the phone line on the
input side of the xformer and the output of the xformer to an rca cord...
walla a wire tap that does not drop the voltage on the line enough to
keep the phone off the hook, you can leave it hooked up all the time, put
on an aux input on your tape deck and make it easy to record any calls
that come in, even better find a way to mod a call i.d. box for a
reconizable # to trip a relay to start the deck.

I bought my PRO-2006 in 1990,when they were first introduced.
Since mine is an older one, it does not have a light on/off switch,
but rather a dimmer hi/lo switch. I have been using my '2006 continuously
in the "dim" position and the display is still going strong.
If you turn the light off on your '2006 when you are not using it,
it should last a lot longer. From my experience, the bulb does not burn
out as easily as Radio Shack says it does, so I would not be overly
concerned about it.
Hope this helps,

* Crossposted in PGH.GENERAL
* Crossposted in ALT.RADIO.SCANNER
* Crossposted in REC.RADIO.SCANNER
* Crossposted in AOSC_SCAN

Hello All!

Reply-To: rccons!rec@telerama.lm.com
X-FTN-To: All

Are you a radio scanner user?? Would you like to get more use of out of your scanner??

Are you interested in receiving information about major happenings in the area??

Then the PA/OH & AOSC News Net may be for YOU!

This is a system similar to that outlined in the April 1994 issue of Popular Communications.

We will use Motorola Advisor alpha numeric pagers to receive information on breaking events in areas you may not normally monitor. Now HEAR ALL the ACTION as it happens.

The pager provides coverage as follows:

Northern OH (Columbus, Toledo, Cleveland, Youngstown/Canton/Akron)
WV Panhandle (Wheeling, Weirton)
Western PA (Erie, Pittsburgh, Johnstown, Altoona, Bradford)

Cost INCLUDES PAGER RENTAL: 1-5 Pagers $20/Mo.
6-10 Pagers $18/Mo.
10-15+ Pagers $16/Mo.

Cost is based on TOTAL NUMBER of pagers in the group.

Airtime only, you provide pager: $13.00/mo.

Purchase Motorola Advisor Pager: $230.00 NEW **
$165.00 USED **

AlphaMate Rental: $15/mo. AlphaMate II Purchase: $450**

Advisor PAL Printer Interface to print messages on IBM type printer: $135**

You will also be able to use the pager for personal messages and/or numeric messages.

What information will be sent?

Information on MAJOR incidents will be sent to the notification system.

***** TARGET OPERATION DATE: JANUARY 1, 1995 (1/1/95) *****

DUES: A minimal amount of dues will be collected to help fund the costs
of voicemail, dispatcher notification, & general network operations.

At this time DUES ARE SET AT $20/YR.

Applications for membership as a member or dispatcher may be obtained by:

US Mail, enclose a stamped self addressed envelope to: R.E. Christian
PO BOX 12763
Pittsburgh PA 15241-0763

Internet, send a messgae to: rccons!pageapp@telerama.lm.com

This will return a message with information & an application.

**** APPLICATIONS WITH DUES are DUE BY: 12/1/94 ****

Many THANKS to John Linko of Pittsburgh. His INVALUABLE INPUT & PREVIOUS
RESEARCH have made this whole process much simpler.

For PA/OH & AOSC New Net,

John Linko,

>
> Overall I think they are both fine radios with each one having some
> strengths over the other.

Would the clearer HF be a function of the antenna you selected
for the Yupi vs the aor8000? Some radios overload with too much signal.

What are the compartitive strengths of these two radios in your opinion?

I noticed that someone said the aor8000 sucked for scanning the 800MHZ
trunking bands because of a fixed delay of 2 seconds and a slow scan
rate of only 30 CPS. My Pro 43 only scans at 40 cps according to
radio shack catalog. An expert user is said in another post to
be able to set the scan delay to .5 second on the Aor8000.
It would seem that it would be adaquate to handel police trunking
if set up correctly. Am I correct?

Gary,
My monitoring the local McDonalds got me a free lunch! We had just ordered and the 'girls' working the window started to get really rude towards us while they were talking headset to headset. The manager who didn't have a headset on was at the window getting ready to hand us our food when I raised the volume on my scanner so that he could hear what the 'girls' were saying. When he did he went balistic and I got a free lunch. The people wearing the headsets can get pretty rude at times thinking they are on a 'secure' frequency.

Since there has been quite a few posts wanting this data, here is a list of fast food frequencies that is listed in the November issue of Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies to every fast food chain for their own use, and that any fast food restaurant can buy whatever low powered FM transmitters / receivers they need for their store at an electronics shop. Anyway, just stick the below in one of your scanner's channel banks, and see what comes up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

Hardee's 30.84 31.00 35.02
151.685 151.805 464.0125
469.0125

Kentucky Fried Chicken 31.00 170.305 457.5375
457.5875

Taco Bell 30.84 154.57 465.8875

Wendy's 33.16 33.40 154.515

Burger King 30.84 457.55 465.8875
467.775

Hi,
I have a Bearcat 200xlt forsale. This scanner has
been modified to recieve celluar. I would like around
$125 for it. The only drawback to this scanner
is that there is no manual for it. But the operation
is pretty much staight forward. Ac 9v adapter is included,
I'll let you try it out for a week and if you don't think
its for you, I'll let you get your money back, (you pay for
shipping costs though). Anyways, if interested, email me
at tnguyen@ms.washington.edu for more info.

RW> smaller scanner that would complete the spectrum if I added the famous
RW> diode that allows cell scanning? Or is there an even better scanner
RW> (complete range) out there?

What exactly were you looking for, Ryan? The unit does have a gap in the 800 mhz band, but that is easily rectified in 2 minutes and a pair of wire clippers. The gap in the 520 to 760 Mhz is UHF television...so nothing worth getting here.

Jerry

From: hancock@access.mbnet.mb.ca
Message-ID: <39jngs$6ut@canopus.cc.umanitoba.ca>
Source record: 266058

A friend of mine has offered to do the cell mod on my radio by just removing the diode and not repositioning it in D4 for low band coverage. He says it's not worth moving the diode since the reception on the low band freq. is not very good. Any other opinions out there? Should I let my friend just remove the diode or should I insist he resolders it into D4?

Thanks in advance!

5022. Caller ID experiment results

Newsgroup: rec.radio.scanner
Date: 1994-11-07 02:18:57 UTC
From: shawn4sk1@aol.com
Message-ID: <39k2qh$lb5@newsbf01.news.aol.com>
Source record: 266063

I tried to do a basic Caller ID experiment being it makes for a great weekend education project... A phone cord consists of a red (power?), black (ground?), yellow and green wire and the RCA jack consists of a red (positive) and a black (ground)... How to wire this all up together? I didn't have a clue. I tried a few ways, keeping black and black connected and attempting to call myself after connecting the various phone cord colors to the red RCA wire. None of them phased my Caller ID box.

My for-now conclusion: as I have noticed nothing different in the way my cordless sounds, from the scanner's point of view, since the service came into my area (no tone bursts or anything new over the air) and the Caller ID box goes inline first from the wall before ever reaching your phone and/or answering machine, I would have to say that the Caller ID information is sent through one of the wires, never reaching the cordless phone... Unless the cordless base had a built-in Caller ID feature (some do now), I would think there would be no need or ability for a regular cordless to ever "hear" the information anyway... But even if the Caller ID feature _was_ built into the cordless though, it would have to be "broadcast" to the handset or base. In either case, I don't think that's how the technology works... I'm sure it's a wire thing...

:-(

From: gtolar@blkbox.com
Message-ID: <39k8qv$le5@news.blkbox.com>
Source record: 266068

Caller ID works like this:

Between the first ring and the second ring a data burst with the ID info occours. It is exactly the same as a 1200 baud modem. You could even modify a 1200 baud (or greater) modem to not hold the line off-hook and monitor the phone line. Unless cordless phones are designed to detect caller ID, that data will NOT be broadcasted. Since the base needs to detect the 90v pulses for the ring and convert them to a data burst the handset is designed to detect and then simulate a ring. If you try moding a modem for this (a simple .47pf cap. at the phone line end of the isolation transformer ought to do it) just set you comm software for 8n1/1200 baud and there should be no need to decode it. It comes out as ASCII (with a little bit of noise from the ring signal on either side of the data burst). Happy hacking!

Yes. And Usenet News articles are public domain. Now if email were being
intercepted and it could be proven, I'm sure the intelligence community has
some "international communication" rationale that circumnavigates the domestic
surveillance exclusion. But they'd never make a public statement on the subjectunless they
had to...

>Andy

Kent state was National Guard. They have no Constitutional prohabition on acting against U.S. citizens as the U.S. military does. But the thought that scares the hell out of me is that somewhere someone is thinking about using troops to forcibly take our scanners\guns\liberties away. Paranoid maby, but that dosn't mean that it isn't so. Remember if they really want to keep us from knowing they first have to remove out ability to hear them comming, ie our radios (this is reason enough for this thread to be in this newsgroup).

Your freedoms and Constitutional liberties are at stake.

Here is how they have screwed you in the last few years:

Scanner ban
Digital Telephony's wiretap provisions
Digital Telephony's equipment bans
"Assault" (Civil Defense Weapon) Ban
Illegal retroactive tax increases
Plans ot outlaw non-government approved crypto
etc etc etc

Throw all Washington Incumbents out of office! You will sleep better knowing
you have done your part at restoring liberty to this misguided but great
country your fathers have fought and died for. Do not let their deaths be in
vain, vote to restore liberty and democracy in our country.

(snip)
>Shawn

The wires you are using aren't the right pairings. The red goes with the
green, and the yellow with the black. I believe the red is the negative
and the green is the positive (go yell at Western Electric for reversing
the conventional red=hot arrangement). At one time the yellow was used for
the input to the ringer; some old phones I have found will not ring unless
you connect the yellow and green wires together (INSIDE the phone, not at
the jack.) These are the old W.E. phones with the mechanical ringers. On
a modern setup, the yellow wire is only used as the (+) terminal for a second
line on a two-line jack (with the black being the (-) terminal). If you
have only one line, there won't be anything even connected to the black wire
in the wall jack.
Note also that a dial phone with a mechanical ringer doesn't care about
the polarity; it's only needed for a Touch-Tone or other electronic-type

Been scannig in the high freqs, found some audio for cable-tv channels.

I found audio for abc and nbc, aswell as some other channel that had something else which I didn't recognize.

These freqs were 888.200 and 926.???, around in that area. In fact nbc was on 2 frequencies, as clear as can be.

I can lock in anywhere in the city, so it's not something just local to my house.

Would anyone know why this is happening?

Sounds like things are working just fine-

1) The CHP mobile repeaters on 154.905 are very low power- they're only
built to go between the officer and the car

2) Standard operating procedure is to leave them off until/unless exiting
the vehicle (to make life harder on folks with scanners?)

D3 - enable 54-88 MHz (nominally 68-88 MHz)
D4 - disable U.S. cellular
D5 - step cellular at 12.5 kHz (vs. 30 kHz)

If you have an international version of the PRO-43, there should be diodes at D1, D3 & D5. The US/Canada version has D1, D2 & D4. Moving the diode _from_ D4 to D3 will give limited reception of TV chs 2-6, but the filter for that band has 10 components tuned for 30-54 MHz and reception will be poor at best. Installing D3 won't hurt but, unless you have an overriding interest in the 72-76 MHz range, it won't help much either.

This might be a little much to ask for, I am new to this.

Is there a way to get a frequency listing for southern NC and nother SC.

If so, please respond by mail to (I am using someone elses account at this time):

KDAVIS@CMT.CHM.TEC.SC.US

Thanks,

Kyle H. Davis

5070. WTB! I know you have one!!

I am looking to buy a first scanner, and I know pretty much what I want-

Somewhere between 100-200 channels
Handheld (pref.) or Mobile, or Base
Preferably NOT modified for cellular (but retaining ability to do so)
General coverage expected of such a scanner (don't need Air Freq.s)

This is the same scanner you bought a while back, before you upgraded
to what you now have. I know you were hanging on to it for no reason
whatsoever, but nows the time to clean it out of that electronics box
you've been accumulating in the closet/garage! Give a beginner a chance
to get in on the action. Any variations on the above will be considered!
However, I am the epitome of a 'starving-student', so please offer a
very reasonable price.

Thanks to you all. The five minutes you take to find and dust-off that
scanner you were never intending to use anymore has the ability to brighten
the day of someone whom you have never met!! WHAT A GOOD FEELING!!!

Eric
(browere@einstein.cnrs.humboldt.edu - Ignore above address; it is wrong.)

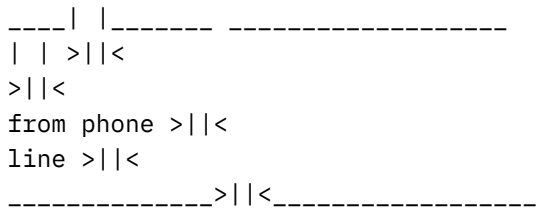
Well, I only know this by theory rather then fact, I must confess. I've
not tried this myself. You can find a cheap slow modem these days.



transformer inside modem

You will likely have to cut a trace on the PC board to fit it in there.
(or place the cap in the phone line going to the modem)

Send an ATS1=1 might fix it to look for the data burst.

As you can tell, I don't do documentation! Hope that clears this up.

Oh, I also have a gif on how to make a RS-232 interface to a caller ID
box for anyone interested.

[from the 11/7/94 issue of THE SPOTLIGHT]
Live Ammo Left At Scene of `SWAT'
Exercise Endangers Civilians

Live ammunition, including an armed
grenade, were left at a practice raid site
in suburban Detroit.

EXCLUSIVE TO The SPOTLIGHT BY MIKE BLAIR

An investigation by the Michigan state legislature is
being pressed as the result of a series of attacks by
what appears to have been SWAT type teams of a
multi jurisdictional task force, including National
Guard or regular Army troops, in a residential area of
a Detroit suburb. Following the incident, which
involved live ammunition, an investigation at the scene
was conducted by a Michigan state representative and
aides, revealing a live grenade, detonators for plastic
explosives and live rifle and pistol ammunition left at
the scene by the mock attack force. The vacant build-
ings in which the SWAT exercises took place were not
properly secured afterwards, leaving the live ordnance
littered about within the buildings to be picked up by
curious children who live nearby.

"This sort of thing is outrageous and must be stopped," an angry state Rep. Deborah Whyman, a Republican who lives in nearby Canton and represents the 2lst District of the Michigan House of Representatives, told The SPOTLIGHT. The first incident occurred during the night of September 21 when residents living near the vacant buildings, located near the Willow Run Airport in Van Buren Township east of Detroit, called township police to complain of automatic weapons being fired.

The area is in the vicinity of what was once the largest single manufacturing operation ever housed under one roof, the nation's biggest bomber factory operated by the Ford Motor Company during World War II. After the war the site was utilized by the Aeronautical Research Center of the University of Michigan and by the Packard and Kaiser-Frazer automobile manufacturing companies.

The Van Buren Township Police, who apparently had not been notified that the SWAT teams were going to be using live ammunition, told the residents that blank ammunition was being fired and tried to assure them that only training exercise were being held and they were not to worry.

Then, on the morning of September 28, more automatic gunfire and explosions erupted at the site, which includes 12 vacant houses and some surrounding property that had been purchased by Wayne County two years ago for extending the runway of the Willow Run Airport.

Again, frightened residents called police and reported the disturbance but to no avail. Some of the residents said they saw "Special Forces soldiers" involved in mock raids on the abandoned houses.

Rep. Whyman was asked by a constituent with a military background to visit the site to personally inspect the live ordnance that had been left behind by what were describe by Van Buren Police as "Department of Defense personnel," who had last been at the scene.

In the first of several houses inspected by Rep. Whyman, her aides and a number of military experts, live .223 caliber cartridges were found littered about the stairway and in the cellar of the building. Bullet holes were found in the walls.

The .223 caliber cartridge is fired in the M-16 U.S. military automatic assault rifle.

It was noted that the cartridges contained soft-point, expanding bullets, outlawed in warfare by the Geneva Conventions due to their ability to cause large, gaping wounds.

On the second floor, the legislator was horrified to find a stun grenade, from which the pin had been pulled but had failed to detonate, leaving it in a highly volatile state.

Other spent grenade casings littered the houses that were inspected, along with live 9-millimeter rounds, which could have been used in either semi-automatic pistols or submachine guns utilized by the attack teams. Also found in the first house inspected by Whyman and her inspection party was a large photograph of David Koresh, leader of the Branch Davidian group, who died with his followers when their compound in Waco, Texas, was burned to the ground by FBI and other federal agents and personnel when it was attacked by them last year.

In an upstairs bedroom_ of one of the abandoned homes a large gaping hole penetrated a wall to the outside of the building, which military experts with Rep. Whyman told her was probably caused by a detonation of plastic explosives.

While the group inspected the buildings they were being kept under surveillance by men in two vehicles, a gray station wagon and a black sedan. They were believed to be federal agents.

Rep. Whyman told The Spotlight that they were also being watched during their inspection tour by a uniformed Michigan State-Police officer, who drove past them several times in a marked Mustang highway patrol car, normally used for high speed pursuit.

Later, after the group had left the scene and gathered to discuss the situation over lunch at a local fast food restaurant, Whyman noticed that the same state trooper still had them under surveillance from the restaurant parking lot.

Rep. Whyman said that Van Buren Township Police seemed genuinely disturbed and puzzled about the incident, while Wayne County Police, who appeared at the scene during her inspection tour to collect live ordnance, were "less than cooperative."

The live grenade was placed in what was described as
a "bomb box" and then placed on a truck and taken
from the scene by Wayne County Police, who also
collected the live cartridges. Later, although the live
ordnance found at the scene had already been photo-
graphed by local Detroit television news crews,
Wayne County Police spokesmen claimed that it did
not exist at the scene, leading Whyman and others to
conclude that the county police may have played some
part in the multi jurisdictional task force exereise. Rep.
Whyman made certain that the police had cleared the
area of all live ordnance and had aecured the aban-
doned buildings before she concluded her inspection.
The state representative told The SPOTLIGHT that
she intends to press for legislative hearings to deter-
mine precisely who was involved in the mock attacks
on the vacant buildings and who was responsible for
not properly clearing the area of live ordnance, thus
endangering the lives of neighborhood children. She
said she also intends to introduce legislation making it
unlawful to use live ammunition in such operations in
Michigan and that if multi- jurisdictional task force
egercises are held anywhere in the state prior notifica-
tion must be given.

5080. RadioMap(TM) expanded to 50 states, new street mapping, too.

Newsgroup: rec.radio.scanner
Date: 1994-11-08 00:51:17 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <CyxBpI.6EG@nntpa.cb.att.com>
Source record: 266006
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

After locating transmitter sites for several radio hobbyists in NY
and the Great Lakes states, I am expanding RadioMap(TM)
transmitter locating service to all of the 50 states in the USA.

Under a new licensing agreement with a major mapping company,
RadioMap now shows transmitter sites on a detailed, color street
map of the area you request.

From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

I offer a service which locates FCC licensed and selected |
FAA transmitter sites in an area of your choice, and |
produce a custom color map. I call this new innovation |
RadioMap(TM) service. It allows you to identify antenna |
sites (including paging and cellular phone cell sites) and
visualize the transmitter locations in your neighborhood,
near your office, at an airport, and other places of |
interest -- from VLF through microwave. |

This is completely different from the limited maps |
displayed on the Grove Enterprises CDROM. Through a new |
licensing arrangement with a professional mapping company, |
RadioMap shows detailed streets, railroads, rivers, and |
cities. Ham radio stations are not shown as they would |
clutter the RadioMap. RadioMap includes key sheets which
list frequencies, callsigns, and licensee names. In rural
areas, ranges of up to 10 miles are possible, while ranges
of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, |
suitable for framing or laminating, for areas in any of the |
50 states. Send me $19.95 for each color RadioMap, your name,
address, and telephone number, along with center location |
(nearest intersection of 2 streets, or latitude & |
longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL |
60543. tel. 708-554-3839 6-10 PM central time.

If it is Motorola Gear, It is not possible to monitor even if you
purchased a mobile terminal for $2000.00. There is no way to monitor
most MDT systems with proprietary operating systems. So unless you want
to purchase a DSP based modem, and spend more time writing code than the
developers of MDT systems, forget about monitoring MDTs.

I have an old crystal-scanner which does something like that.

When they switched from 80 MHz to a trunked system in the 400 MHz band
the scanner didn't always stopp at the beginning of the transmission but
merely in the middle or the end of it. The 400MHz oscillator didn't always
start oscillating when the crystals were swithed on to it. I changed some
capacitors and found some values that made it more reliable.

On several occasions but very seldom (have to scan maaany hours for it to
occur) i have expirienced such a phenomena. Suddenly a empty carier comes
up and yoy can actually hear that it is sliding in frequncy.
It doesn't stay long on that channel before it moves off sometimes coming up
on one of the others.

It has also happend when i have had the cabinett taken off. It is very
sensitive just moving your hand quite far from the radio can make it drift
in frequncy. It's "microphonic" i.e. tapping on the cabinet results in a
metalic clinging sound in the loudspeaker. No doubt one stage is self-
oscillating in a way it's not supposed to. I think it's doing it all the
time but since it's only rarely "hitting" one of the frequncies i have
crystals for i don't want to fiddle with it.

I also have a pro-34 but have never had any such problems with it.
My guess is that some stage is self-oscillating in your receiver too.

If it's microphonic when tapping on the cabinett it indicates that it's
generated by some LC-circuit in the radio.

Haruteq, April 1992 edition available at most ham radio and quite a few Radio Shacks has the entire listing for the OPP's new frequencies.

If you can't find a copy, e-mail me and I send them to you.

Christopher

ANNOUNCING ....

The first regional newsgroup for scanning -- phl.scanner

This new newsgroup was created for scanner radio listeners in the Greater Philadelphia area who wish to discuss scanning related topics. This is the first regional newsgroup for scanning ever created.

This new newsgroup should be used only for discussing local radio systems in southern New Jersey, eastern Pennsylvania and northern Delaware. Other scanning related topics should be kept in the rec.radio.scanner newsgroup.

The purpose of the new newsgroup is to allow local discussion of local radio systems without the noise generated by international newsgroups related to the hobby of scanner radios.

So, tune your Internet connection to phl.scanner and discuss scanning in Philadelphia and the Delaware Valley.

From: eab@msc.edu
Message-ID: <39n7bd$fnk@uc.msc.edu>
Source record: 266020

I've got a bearcat 700a that I picked up at best buy for $159 plus tax.
It has the cellular frequencies disabled (but said 800 Mhz on the
box, making me think it was cellular ready). Is there a mod available
for this scanner? Is it a _good_ scanner for the price I paid?
The date code on the back is "0fic"

Also, the scanner didn't come with a manual. Anyone got one they're
willing to part with or photocopy?

Thanks a bunch.

I don't think you will find the PRO-2026 will work in the
225-400MHz band after modification. The only RS scanners that
will receiver UHF air are the PRO-2006, PRO-43 and their new
PRO-2035 & PRO-62 (I think thats the model number).

Errr...I guess a typo Vic :-)

The MVT-7100 has a built in delay of 2 seconds with a so far
unfound way around it which does make life awkward on trunked
systems I understand.

The delay on the AR8000 can be set to what the user wishes, I
havn't heard any feedback on how well the '8000 works on trunked
systems.

It is the Yupi that has the mandatory 2 second delay. The AR8000 can be set
to anything for a delay, including zero.

5102. ? on aircraft frequency guides

Newsgroup: rec.radio.scanner
Date: 1994-11-08 10:21:45 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.4.000A5D18@ccm.hf.intel.com>
Source record: 265944

I have not spent a lot of time monitoring aircraft, but I am looking to get more involved in it. I recently received the Defense Mapping Agency catalog of Aeronautical Charts and Publications.

What I am trying to figure out is which guides are worth while. In particular, route guides and frequency information for military and civil aviation would be the most helpful. Any comments an the following guides? :

1. Area Planning - Military Training Routes (both book and charts)
2. USA IFR supplemant
3. USA VFR supplement
4. High Altitude IAPs (northwest)
5. Low Altitude IAPs (Vol. 3)
6. Civil SIDs/STARs (western)

OTHERS??

Thanks

>would be appreciated. Thanks. By the way, these units are small hand held ones.

There are many books out there with Yagi info. You may want to check your
library first (you might be surprised what you find). Otherwise check out a
Ham radio store. There is a very good antenna book I have called the ARRL
Antenna Handbook. I think it was about $28. I have seen a smaller book that
covers just Yagi Beams that is less expensive. To be honest, I have yet to
see a book that makes it simple to design your own Yagi. Without some antenna
theory, constructing a balun to match the antenna is not trivial. If you are
not going to transmit with the antenna, I'm sure it will be fairly simple to
make a Yagi that will work for you.

Also there are several programs available via FTP that will help you design a
Yagi, but the interface is usually rather crude and requires you know a little
about antenna theory to begin with.

: Radar detector *detectors*??? Egads. How do they work? -Pete.

Yep. They detect the slight leakage of the IF in your detector. Most all use a 1 GHz IF, so listening to 9.525 or 11.525 GHz will given them the info for low band radar detectors. Ka band are similar around 24 GHz.

Actually thank God for the right to vote. We do still have that right
and barring massive fraud such as what has occurred in other countries,
it appears the results of our voting actually decide who takes office and
who does not.

So today is the day we get to end the 40 year assault on our liberties
which have been carried out by the Democratically Controlled House.
Also today we can begin to reverse the 60 years of damage inflicted on
the American People by a Senate controlled by Democrats for all but
12 years out of the last 60.

People, it is time for a change. This is what Bill Clinton ran on in 92,
People gullibly elected him wanting change, but like fools they
sent the Democrats back to control Congress for another 2years. Now
the Democrats have controlled Congres for 40 years without interrruption,
they have controlled the Senate for all but 12 years out of the last 60.

Most of us have not even been alive that long. We say we want chang,
how in hell do we expect change when we keep sending the same party
to back to Washington to control the purse strings?

A vote against the Democrats is a vote for change. Let's have a well
deserved change of leadership in Washington. Vote today against
all Washington Democrats!

leading my list:

Feinstein no (not just no, HELL NO!!!)
Eschoo no
Mineta no
Stark no
Foley no
Gonzales no
Brooks no
and the list has many hundreds more!

Be sure to tune to FEMA frequencies tonight to hear the precinct
captains getting their orders on where to dump the ballots, where
to get the illegal replacements that they had printed up
over the weekend :-) (hey I needed some radio content in this post!).

So send the strongest legal message we can to Washington: we are sick
and tired of the Democrats controlling the Congress, we are fed up
with Bill Clinton's failed liberal agenda, we want real change
and we are counting the days until the 2nd Tuesday of Novbember 1996!

Unless there's some sort of trunking prohibition under 800 MHz, I don't
see any reason, legal, technical, or otherwise, why it couldn't be done.
I think the Feds have a couple of operational 400 MHz trunking systems
already.

>Is this unit modified for this rate?

$180 is a bit high for one thing. If I remember correctly, the 34 comes
with an 8 channel scan rate. I modified mine for about 15 cps. I would
not believe 50 cps without seeing it.

5128. WARNING! Long response to right-wing polemics

Newsgroup: rec.radio.scanner
Date: 1994-11-08 19:03:38 UTC
From: briskin@binah.cc.brandeis.edu
Message-ID: <39oi2a$pc2@news.cs.brandeis.edu>
Source record: 265949

The following message is exceedingly long, and I truly apologize for going off-topic, but I couldn't help myself.

Much as I hate continuing to respond to Mr. Crisp's continuing diatribes, I feel compelled to post my one message to every 10 or so that he puts out.

What we seem to be seeing these days in the rec.radio groups is the Three Faces of Crisp. The first face, the one that I truly like, is the incredible source of knowledge regarding radio-related issues, a man who is generous in responding to newbies and pros alike.

The second side of Crisp is the one who wrote "Public Apology." This personality fairly blames EVERYONE in Congress for supporting the anti-monitoring legislation, and suggests voting out ALL incumbents who voted for it. As non-partisan as this view might be, it's also rather naive. It would, of course, require that favorite right-wingers like Jesse Helms, Strom Thurmond, Bob Dole and Orrin Hatch be tossed out, and fails to consider that throwing these individuals would hamper the Republicans' ability to pursue their right-wing agenda.

Then there's the third side, the truly scary side. This Crisp wallows in right-wing political paranoia, which really doesn't belong in the rec.radio groups. This Crisp frightening calls the 1992 election "illegal" and the administration that took over a "regime." In all fairness, Mr. Crisp, even the most liberal-leaning Democrat would have never called the elections of 1968, 1980, and 1988 "illegal" or refer to the Nixon, Reagan and Bush administrations as 'regimes,' even if the patently illegal acts these individuals committed (such as Watergate and Iran Contra) during their reigns trashed the Constitution. If you don't like the President, his views or his party, that's fine. But don't insult the intelligencce of the millions and millions of us who didn't vote for your pet candidate that we're all co-conspirators, or that the election was rigged, or that Mr. Clinton did not assume power legitimately. Sour grapes is one thing; rampant denial is another. You yourself promised in your 'public apology' to refrain from political grandstanding. Why can't you keep to it?

RC>So today is the day we get to end the 40 year assault on our liberties which have been carried out by the Democratically Controlled House.

Whose reign, fortunately, has helped, in large part, prevent our mostly Republican presidents from turning the entire country over to Big Business, overturning a woman's right to choose, installing fundamentalist religion into our schools, ruining the environment, endangering public health, executing people who have since been found to be innocent, removing programs designed to innoculate poor children and give them a chance at education.

Unfortately, these same Democrats weren't able to prevent those wonderful pillars of honesty and integrity Tricky Dick Nixon, Ronnie Raygun and George Bush and their Republican and conservo bo-weevils from invading Cambodia, trashing the Constitution through Watergate and Iran Contra, selling out our hostages and diverting the money to known Central American cocaine dealers, cutting taxes for the top 1% of society, increasing the gap between the rich and poor to record levels, increasing the deficit to its highest level in history, and giving Big Business their blessings to eat each other up, lay off millions of workers, send millions more jobs overseas, and cause the S&L scandal.

RC>Also today we can begin to reverse the 60 years of damage inflicted on the American People by a Senate controlled by Democrats for all but 12 years out of the last 60.

It took Dick Nixon only 2 years to totally destroy America's faith in government. It took Raygun 8 years to bring America to ruin. It took George Bush four years to show he had no ideas other than protecting our oil interests by waging the Gulf War. Both parties of Congress are equally to blame for being totally run by special interests and for doling out pork by the shovelful. But, let's face it, when it comes to wrecking America and the Constitution, no one does it better than our Republican presidents.

And let us remember that ALL of the anti-monitoring legislation we all hate was born in the Reagan/Bush era, approved by these presidents and formulated by an alliance between the cellular and phone manufacturers and the FCC, whose ranks were and are still stacked with Reagan/Bush appointees. And since just about all senators voted for it, it stands to reason that there wasn't a huge protest by Republicans to prevent its passage. Meaning that either the GOP supports the measures, or simply doesn't give a damn about the ability to radio hobbyists to listen to whatever they want.

>People, it is time for a change. This is what Bill Clinton ran on in 92, People gullibly elected him wanting change, but like fools they sent the Democrats back to control Congress for another 2 years.

Yes, and the Democrats, with no help from Republicans, have managed to help cut the deficit by billions of dollars, create a

strong economy after Bush/Reagan wrecked it, given aid and support to the millions of Americans who lost their jobs because of GOP laissez faire and reaffirmed a woman's right to choose. Let us also remember that Bill Clinton himself got NAFTA, the biggest trade treaty of the last 25 years, through Congress with the help of Republicans, a feat Bush would never have been able to accomplish. Not to mention making an attempt by any President to try to streamline government and solve the healthcare crisis. He might have had the wrong ideas, and he might have failed, but at least he TRIED.

RC> Most of us have not even been alive that long. We say we want change how in hell do we expect change when we keep sending the same party to back to Washington to control the purse strings?

Is this the same Richard Crisp who only a few weeks ago

Yes, the GOPers must have cut off my message before I could finish it. I won't post the remaining 45 pages, but I'll finish up by saying I wish Mr. Crisp would practice what he apologized for, and stick to his promise not to off-topicly continue hiseh right-wing rampages.

I do, however, wholeheartedly agree with Mr. Crisp that voting is truly our most cherished right and that, whether you support Feinstein or Huffington, North or Robb, Kennedy or Romney, having the GOP take over or keeping the Democrats in control, that you vote, vote vote for what you believe in. Or, as we say here in Boston, vote early and often! :)

I have noticed the same thing on my BC200. I've tried a better antenna
when mobile and had better results, but I still seem to be limited to
about 6 or 8 mile radius. My guess is that the mobile units are using
low power and that the disptcher has a "great" antenna, but it is only
a guess at this point. Any other ideas out there?

Because if two aircraft transmit on top of each other, or there's
a stuck mic transmitting just carrier, you can usually hear the
other aircraft transmitting, as the two signals mix. In FM, the
stronger signal captures the receiver and you hear nothing of the
weaker signal. It would be more efficient these days to use SSB
but AM works fine.

Thanks, too, for the well wishes. I've been enjoying the 2035 ever since it arrived. While to some having the Cell Phone frequencies is important, I find myself more interested in the police/fire/rescue activity (with town road crews thrown in when the snow falls). The old Bearcat 800XLT I had been using was capable of tuning in the Cell freqs, but I rarely ever availed myself of it. (Speaking of which, if anyone has suggests with a contact for repair of the Bearcat, I'm all ears. Its demise is what prompted me to purchase the 2035, but I'm interested in getting the old one fixed. Its display started to take longer and longer to "warm up" and appear when you turned it on ... then select frequencies would fail to be tuned until it "warmed up" ... then it could take hours for the "warming up" to take place).

As far as the 2035, now that I've toyed with it for over a month, having the 1000 channels is a welcome relief. I didn't think I'd fill 'em all up since outside of the state police here in NJ, most systems are not trunked but good ol' single freqs with some having a secondary. What has been the biggest benefit is being able to program in much of the Central Jersey area -- dividing 'em up in banks for police, fire/rescue, road (and even making one for the state). I didn't realize how much "interplay" there was since I had been

limited with the 800XLT to 40 channels and didn't have the pleasure of being able to rapidly here adjacent towns working their freqs when a common action is taking place.

It's been great, too, since NJ is so under-reported on the news. Found out, as it happened, about a guy who jumped off the Parkway bridge on this past Sunday (complete with one officer radioing in something like "I just saw him go over") to a car chase a few weeks back that started down in the Brunswicks and made its way up the Turnpike over into Edison (I think they lost two police cars that night). It's amazing what an old Radio Shack multi-band scanner antenna placed against an outer wall of the upstairs crawlspace will pull in!

For folks who laugh at the need for 1000 channels -- as I said -- it's not just trunked activity that eats up the slots.

The center-loaded telescoping whip retails for 9.99 (Radio Shack Cat # 20-006).
I've used one on my old Pro-32 and, yes, it does a far better job than rubber
ducks typically included with the portables.

Source record: 265897

It's sad but true. Even though it is not *illegal* to listen to cellular calls
in Canada, Radio Shack stores in Canada no longer sell cellular capable
pro-43 scanners. If you are in Canada and plan to purchase a pro-43,
check the serial number first. If it starts with the letter "A" (A123456) then
it is no longer cellular capable. I am not sure if the same is true with
other models. Has anybody else had similar findings with other RS models
in Canada?

>Why do aircraft communicate using AM, when almost all other
>communications use FM?

>Confused :-(

There was a lengthy thread on one of the aviation newsgroups on this not too long ago and I don't think anyone had the ONE answer.

1. On HF aircraft use AM/SSB. When the VHF band was allocated (when? I don't know) the proven modulation method was AM. This is an international allocation so everybody else - third world, and whoever - had to jump on the same band wagon.

2. At the time AM likely took less bandwidth than "narrow" FM. Today's narrow FM technology could do the job but you would have to change the whole world. The probability of getting "buy in" on that from the aviation world, especially the smaller operators, would not be high.

3. Some claim the reason is technical, but I don't buy it. Some say the "capture" effect of FM may cause a controller to miss a distress call or something if two planes keyed up at once. But AM has quite an effective "capture" of it's own (remember that VHF aircraft is A3E - there's carrier). With no modulation, and AM and FM carrier are the same. (Actually, if there is no modulation on a signal I would call it CW) So I think all of the capture argument is pretty lame.

But hey - what do I know!

From: jeffrey@kahuna.tmc.edu
Message-ID: <Cyz45E.923@news.Hawaii.Edu>
Source record: 265901

I received a mail order catalog from the Damark company - they're advertising a Bearcat INF5XLB preprogrammed scanner for $39.99. The description they provide is rather thin, so:

1. Can the user change the preprogrammed frequencies? There is no keyboard visible in the photo.

2. How many channels is this pup capable of scanning?

3. What's the frequency range?

This item is `factory serviced' meaning it was returned by a buyer and Bearcat sent the buyer a new unit, serviced the returned item and gave it to Damark to liquidate.

Thanks in advance.

Jeff

Because AM was in use for aircraft while FM was still being developed.
By the time FM was ready, it would have been too difficult to switch
over world-wide.

There's a couple of paragraphs about it in Police Call (ack, you're in
the UK - sorry).

I have an old Uniden handheld that finally died. I am trying to choose between a Pro-51 or a Sportcat to replace it. The Pro-51 is $299.00 and the Sportcat is $186.00. Considering all the mods. that are available, is the Pro-51 worth the extra cash?? Both are made by Uniden in the Phillipines and I tried the keyboard trick to put the Pro-51 into the service scan mode (band,2,9..L/O,2,9) but it did not pick up anything in the store. The Sportcat would pick up decent in the store but I did not know of anything to try on it. So... Any and all information will be greatly appreciated. Thanks.

Source record: 265971

I have a Radio Shack Pro-2004 scanner radio for sale. It preceeded the 2006, and has about the same features. It covers 25 thru 1300 mhz (including cellular) and has 400 memories arranged into 10 banks. It has the same sort of mods possible for it that the 2006 does, and most of these have been done. It runs on ac or 12v dc and includes a telescoping antenna that plugs into a bnc connecter on the rear panel. In perfect condition, it includes the manual and the original box.

Asking $275. I will pay the shipping.

Yes, but there is *nothing* to stop the Canadian dealers from going to Tandy or Radio Shack or InterTan or whatever and saying we WANT cellular modifiable units, therefore SELL us modifiable units OR we go to UK/Europe and IMPORT them and leave you stuck with stock that will NOT sell since those who have a choice would not buy them -- those dealers with the modifiable imported stock would then have the edge on the situation -- as I suspect Atlantic has already realised.

The point I am making is there is NO law in Canada preventing COMMERCIAL importation of the real scanners from the UK/Europe and no way InterTan can force them to accept second-rate poor quality North American rejects.

SPREAD THE WORD! THE PRO-43 "A" models are NORTH AMERICAN REJECTS!! SPREAD IT FAR AND LOUD! THEY ARE RETURNS, REBUILT, REJECTS without full coverage.

Tell tandy we will not settle for their second-hand north american censored GARBAGE! As far as I know Atlantic in Canada still can get them. If they can anyone should be able to.

You sure you cut jumpers and not the 800Mhz coils? Coils at that frequency
will look like jumpers and small loops. You may have just blown the scanner
800Mhz specs of the page! (Guess we'll be seeing it for sale, eh? :-)

The IFR sup is great with a ton of freqs. I would also get the high and low alt charts. Better still, since you are a fellow Utahan, contact me via email and I'll send you a ton of freqs all ready to
go!

I monitor Hill AFB and much of the other air traffic in this area. Are there any other aviation monitors out
there from the Hill AFB/ Utah area? Contact me so we can talk.

Some time back a chap from Canada was telling us yanks to forget discussing American politics and the effect it has on freedoms regarding radio gear. He told us that in no one in Canada cares. Some of use told him at the time that irrespective of Canadian Law being more permissive, the fact that the US had a more restrictive law would adversely impact what is available in Canada as the products are designed to be sold in America and some simply gets shipped to Canada.

Well there you have proof that is exactly what is happening.

: the country. For groceries, heating and motor fuel, for farm equipment and
: for lots of other "quantity buying" deals. I ain't heard no screaming.

Excuse me, but you CAN get a cellphone without any obligation whatsoever.
But then you don't get to take advantage of the kickback from the cellphone
operator to the local store. If you ask for a "$19.99" phone *without*
having to sign up for a year they'll sell it to you for something like
$319.99. You'll also have to pay a little more each month. Just look at
the rate sheets. They've always got some rate plans which are month by
month. It sucks, but there *is* a choice...

Now that we have a completely new political situation in Washington as of the first of the year, let's see if we can get some of our rights back.

For starters, let's ask our elected representatives to introduce bills that repeal the scanner ban, remove the equipment and cordless phone monitoring bans from the DT bill and for that matter, take a pre-emptive strike against crypto bans.

Please contact your Washington representatives and let them know that this is your will and that they serve with your will. It is time to hold their feet to the fire!

5178. "Kenneth" Dan Rather Mystery Solved?

Newsgroup: rec.radio.scanner
Date: 1994-11-09 17:57:35 UTC
From: athena@tyrell.net
Message-ID: <Cz0Hw0.B44@tyrell.net>
Source record: 265831
Cross-posted to: rec.radio.scanner,rec.radio.shortwave,rec.radio.amateur

In the Nov. 7 issue of New York magazine, a guy who thinks he may be the real "Kenneth" comes forward to offer a possible solution to the 1986 Dan Rather "Hey Kenneth, What's the Frequency" mystery.

On October 4, 1986, Dan Rather claimed he was attacked on Park Avenue in New York by two well-dressed thugs who pummeled him about the head and kept repeating, "What's the frequency, Kenneth?" Rather has been the butt of countless "Kenneth" jokes ever since.

Now a Ken Schaffer, a Manhattan electronics expert, comes forward to say he thinks the attackers may have meant to follow him home from Columbia University's Harriman Institute for the Advanced Study of the Soviet Union, and mistakenly followed Rather instead.

In 1986, says Ken Schaffer, both he and Rather were frequent visitors at the Harriman Institute. Rather, because he was about to go to Iceland to cover the Reagan-Gorbachev summit; and Schaffer, because in 1983 he had begun receiving fuzzy images of Russian TV on his amateur satellite getup. (Schaffer was also the inventor of the wireless electric guitar in his late twenties, and the article claims he was a skilled ham-radio operator since age 8.)

"Within a year," says the article, Schaffer "developed a system that would track and decode the signal and filter out the city's microwave interference, all of which the satellite experts said couldn't be done."

"By 1985, Columbia students and journalists...could peer into Russian's everyday lives. (Even one of Schaffer's musical pals, Sting, spent an evening at the school watchin g a Moscow production of Porgy and Bess. Deeply moved by the experience, he composed his song "Russians" the same night.)

"Schaffer theorizes that intelligence operatives followed the wrong man--Rather instead of him--home from the Harriman institute."

Schaffer does not claim to know whether the operatives were KGB, CIA, or what.

If Ken Schaffer is on the Net, I hope he will join the discussion. I hope I have been faithful to the article, which is on p. 24 of the Nov. 7, 1994, issue of New York. Please don't get this mixed up with the New Yorker...they are different magazines. This explanation makes sense to me, and I have always found the "Kenneth" mystery intriguing.

Schaffer says he hasn't talked to the media about this before, because they weren't much interested. "I'm as much an observer of the idea as I

am a proponent of it," Schaffer says.

You're wrong. The Constitution of the United States gives you the right
to poke into your government any way you can. Since Congress can't
prohibit that, they didn't.

I don't know of anyone who is FORCED to buy a cell phone. It's a
LUXURY - if it costs too much, don't get one! The grocery example
isn't a valid comparison.
And by the way, if my grocer offered me a discount if I would commit
to an agreement, I would consider it.
Cell phones - like cable TV - are OPTIONAL - if you don't like the
price, the government shouldn't regulate it, you should walk away.
Brian

5182. AOR8000 Government Mode???

A friend of mine recently saw an advertisment for the AOR8000 scanner that stated if you were with the government, you could get the extra features. Is this what I think it is (CP)? Or is there something else to this radio?

Duane

5183. BC8500 Does Cellular

Newsgroup: rec.radio.scanner
Date: 1994-11-09 18:38:46 UTC
From: jocatch@vnet.ibm.com
Message-ID: <39r4vmINNh3c@afshub.boulder.ibm.com>
Source record: 265625

Everyone that I know says that the Uniden BC8500 does not pick up cellular. Indeed, parts of the 800 mhz band are locked out. However, the dealer that I bought it from told me that I could pick up images above 1000mhz.

Yesterday while searching to see what services there are above 1000mhz, I ran into cellluar images by accident around 1270 to 1298 mhz. Why there I don't know. The manual is crap for giving any tec details on the radio. It says nothing about what IF's are so I don't know how 800+mhz gets translated to 1200+mhz.

>Schaffer says he hasn't talked to the media about this before, because
>they weren't much interested. "I'm as much an observer of the idea as I
>am a proponent of it," Schaffer says.

Interesting story!

I first heard about Mr. Schaffer in an article from a guitar magazine about 15 or so years ago (he was running the wireless guitar business at the time, obviously). He mentioned going to a place called Canal Street in his youth -- apparently this was the site of several surplus electronics dealers in the city, and he would be the first one down there in the morning so that he'd get the best selection of parts.

C.K.

5185. Re: AOR AR8000 Receiver

Message-ID: <9411091122.AA33790@txb00-mac1.George>
Source record: 265835

jadantin@ndlc.occ.uky.edu (Jim Dantin) Writes:

:When you first turn on the scanner, what does it do? Does it start
:scanning, or do you have to activate some key first?

When you first turn on the scanner it says:
Welcome to the world of AR8000 reciever. Then it resumes in what ever state
you left the radio in prior to turning it off.

:I'm thinking about buying one, but will use it at night a lot (I wake up
:to sirens, turn on the scanner to see what's happening). Will I be
:fumbling for buttons?

If you turned the scanner off while in scan mode it will resume scanning
right after the initial message.

:You say that banks can't be turned on and off on the fly - do the banks
:that you previously used stay activated through a power-off/power-on?

Yes, the banks you previously used, do stay programed through a power off/on.
(i.e. take your run of the mill scanner, you have, say banks 1 through 10,
you can hit the appropriate key to select the bank on and off in which you
want to scan. With the AR8000, you have "Band Linking", which you
have to initiate by hitting a couple of keys and select the banks you want
to scan, then hit enter to save the changes, etc. (hope this helps)

:Please give us 8000-wannabe's some more user perspective!

Now that Pete Wilson is again the Governor of California,
I must prepare for the inevitable tuition increases.
As a result, I cannot have "Caviar Dreams" on a "cheez-it" budget!

This is what I am looking for, and I hope you can help me out!!

Somewhere between 10-50 channels
Mil. Air (UHF?) NOT necessary
800-900 MHz coverage is a plus (not necessary)
Handheld, base or mobile
Good condition

Let me know. This is the same one YOU bought a few years back when
you just started out. Yes, someone does want to buy it! Let me know
what it is, how much you want and any other pertinent details.
I am not looking to spend very much, so if you'd like to give it
away, that is okay too :) !!

Thanks for your time.

>
> by the way, does anyone know if there is a reset mode or key-sequence for the
> sc150?

No, but I think I can safely say that it's not 2, 9, L/O on powerup!
I tried this once, and got it to cycle through all the LCD segments on
the display. OK, I thought, now it enters a test mode, or has extra
frequencies stored in the first 25 channels, or something like that.
Well, an hour later it was still in the "lighting all screen fields"
mode from left to right, no audio at all, time after time after time.
Hitting any key or key combination at all did not help, turning power
off and on did not help. After more and more messing around, I finally
called Uniden's 1-800 number. And then, after putting me on hold for
awhile, the gal came back on the line and told me that my key sequence
had "locked up the hardware" :-) and that I'd have to mail the unit back
to them for repair. I thanked her and noted that, in addition to never
trying 2, 9, L/O on powerup again, I would never call Uniden help again.
A few hours later I turned power on and all was fine.

: a guess at this point. Any other ideas out there?

Antenna height really helps.
Radio LOS in miles is approximately square root(2*h),
where h is the height in feet. (smooth earth approximation).

Thus, going from 5 ft to 50 ft increases the range by a factor
of 3.2. The scanner ought to work pretty well from a high rise
building or mountaintop, even with a rubber duck antenna.

I've talked with another amateur 83 miles away using a 1.5 watt
2 meter amateur transceiver with the stock rubber duck antenna.
The path was visual line of sight.

There IS something that will detect the VG-2 radar detector detector. BEL
makes it and incorporated it into their new detector. It detects the
VG-2' s IF and when it does detect it it shifts its own IF for a period
so the VG-2 can't detect it. I've heard that a few other comapnies are
making anti detector detectors. Pretty slick stuff. Maybe next they'll
offer a HARM missile interface.

Well Bob, I don't think you could do one of your RadioMaps for my area.
I live too darn close to Motorola National HQ in Schaumburg Illinois.
There's more attennas at that sight then you can shake a scanner at.
And they are not the only ones, there are attenna towers all over this
industrial corridor. The airwaves are a radio swamp around here. Talk
about intermod, I get a weird combination of Ham repeater and data
channel all over 470 Mhz on my Pro 37. Your product sounds nice, but
I don't think you could do one for this spot that would be usefull.

ACE Communications used to sell some of them under the AOR name. For instance,
the TR1200 is the same as the AR1000XLT. The TR2400 is the successor to
the AR1500; sold in Europe as the Camnis HSC-050.

All of them have quirky user interfaces, slowish scan rates, and uneven
quality control. Each has varying problems with birdies and intermod in
various bands. They're all "OK" and many people like them, but there are
much better rigs on the market (e.g. Yupiteru MVT-7000 and 7100, AOR
AR-8000)

5209. BNC CONNECTORS x

Newsgroup: rec.radio.scanner
Date: 1994-11-10 01:42:34 UTC
From: k8zgw@hamnet.wariat.org
Message-ID: <Cz13Ez.Bqr@hamnet.wariat.org>
Source record: 265820

NAME THAT CONNECTOR !

(excepted from an article by K.Britian , WA5VIB in the Ford Amateur Radio League "BOLT", Dec. '93 via Westpark " LOG ")

HAVE YOU EVER WONDERED WHY VARIOUS COAX CONNECTORS ARE CALLED WHAT THEY ARE CALLED ?

Until the early 1930's parallel lines and binding posts were the typical R.F. feed system. When the first coaxial cables were marketed, the first connectors, dubbed UHF (PL-259 /SO 239) were introduced for them.

During WWII the requirements for a better connector prompted two new designs. The first was developed at Bell Labs (where else) by an engineer by the name of Paul Neill, and became known as the type "N" (for Neill) connector. At the same time another connector was being developed by Carl Concellman which became known as the "C" connector.

Shortly thereafter Neill and Concellman collaborated on the design for a miniature bayonet locking connector, which was later dubbed the " Bayonet Neill Concellman " or BNC connector. Later an improved threaded version, the Threaded Neill Concellman, or TNC was developed for airborne uses.

For precision microwave use, a series of subminiature connectors were developed, the A,B, and C. Of these the A, or Sub-Miniature A (SMA) is the most popular.

5211. WABC Shutdown

Newsgroup: rec.radio.scanner
Date: 1994-11-10 02:33:00 UTC
From: bob.kozlarek@woodybbs.com
Message-ID: <93.1218.7592.0NFB595B@woodybbs.com>
Source record: 265863

(New York, November 9, 1994) Broadcast band DX'ers are in for a rare treat this weekend. Word was received today from Mr Bill Krause, chief engineer for New York's WABC radio (770 khz) that the station would go silent for approximately 3 hours to perform antenna maintenance. The scheduled shutdown will take place from 0100 a.m. - 0400 a.m. EASTERN time (0600Z - 0900Z)on the morning of Monday, November 14, 1994. (Note: Most Eastern DX'ers would regard this as very late Sunday evening!) This temporary shutdown will provide Eastern listeners a rare chance to log KKOB in Albuquerque, NM. As this message is being released, the IRCA'a JD Stephens will contact KKOB to investigate the possibility that KKOB may run a special DX test. As KKOB normally runs a directional pattern beamed primarily Westward, the possibility of an omni-directional pattern will also be discussed. Those listeners who are interested should tune in to SPECTRUM, aired on shortwave station WWCR in Nashville, TN. A final announcement will be made at the beginning of their broadcast, on Saturday evening November 12 at 10p.m. Eastern (0300Z) on a frequency of 5.065 mhz. SPECTRUM, by the way is a weekly program for the radio enthusiast, covering related topics from "DC through Light." Reception reports can be mailed to KKOB @ 77 Broadcast Plaza, Albuquerque, NM 87103.

Updates to this message will also be posted on the Monitoring Times BBS as they become available. The MT BBS is available weekdays from 6:30 p.m. to 8 a.m. (Eastern), and weekends 24 hours a day @ (704) 837-9200, (704) 837-7081, or (704) 837-5957. The BBS supports standard speeds with modem settings of "8N1". What a way to start a BCB DX season!

Because it's always been done that way and it would be too much trouble
to change it now.

5217. Pro-2006 Dimmer Switch

Newsgroup: rec.radio.scanner
Date: 1994-11-10 06:13:13 UTC
From: tfisher@boi.hp.com
Message-ID: <Cz1Fy2.Mq0@boi.hp.com>
Source record: 265870

Should be a piece of cake. The EL panel which is sandwiched behind the LC display pane and in front of the PC board can remain intact and should not be touched. The reason for this is that the two connections that are connected to the pc board only can be soldered a very few times, unless you sink the heat and know exactly what your doing solderwise. The EL panels have a connector which is crimped through the palstic in two places, and there is no where for the heat to go except into the plastic and it melts too quickly causing an oxydation pocket near the connector(s) only to premature fail. To Mod or place a dimmer would be difficult as this panel is being run on AC which is being driven by an Invertor Ballast. They operate on 108-140VAC. To put in an on of switch locate the EL Ballast, and open the trace to the DC side input. Run a couple of wires from the open trace to a micro switch which is located to the outside case and wolla you may then turn this on and off at will. Total time 1 hour this includes adding the switch.

If you want to change the backlight colors, there is only one reliable source located in King Of Prussia Pa. They have sent me samples for other projects but I found it easier to put colored mylar(plastic) in either red or blue for a nice custom effect in front of the El Panel, not the display.

Note * LCD displays are either designed for backlighting or not. The manufacturer has to add or subtract a polarized film specific to the display. the LCD designed for backlight allows light to transfer through from the underside, where the non backlight LCD will not allow the light to xfer from the underside, but bounces lumens entering in from the front. Almost like placing a mirror behind the display.

Best Regards
THE SONAR GURU...

The opions are my own not previous, current, nor future employers.

5219. Need advice on putting antenna in attic

Newsgroup: rec.radio.scanner
Date: 1994-11-10 07:12:47 UTC
From: jschribr@crash.cts.com
Message-ID: <jschribr.784451567@crash.cts.com>
Source record: 265781

I live in a condo and so I can not put a scanner antenna on my roof. The next best thing I figure would be to put an antenna up in the attic. I'm thinking of getting a discone because of its wide frequency coverage and omnidirectional properties. In the Grove catalog they sell a discone with an additional vertical element to enhance 30-50MHz coverage for $85 plus shipping. Radio Shack has a discone without the vertical element for about $55. Would that vertical element greatly enhance low band reception (especially cordless phone)?

Any and all advice regarding attic antenna installation, the questions I raised above, or general antenna information would be greatly appreciated.

Jeff

I hate to be the one to say it, especially this soon after the election,
but it is delusional at best to think that there is a dime's worth of dif-
ference between a Republican Congress and a "Democratic" one. All that
Fancy Talk before the election was just rhetoric; no more and no less.

Your lost rights are gone forever...

I've checked several Radio Shacks in my area [Calgary, AB, Canada], looking at PRO-43s in preparation for purchasing one, and none have had any A in the serial, part, or any other number. The only A's I can find are in the words 'REALISTIC 200 Channel Direct Entry Programmable Scanner' or whatever it says on the front of it. Now, I don't know if it means that Calgary sells a phenomenally low number of scanners [doubt it; after I bought my PRO-44 six of my friends, two of my employers, and half the fire department bought scanners too :)], but it ensures that I won't have to worry about there not being any 43s in town when I finally pile up enough quarters to get one.

Not that I want to listen to cellular anyway, so I guess this is kinda moot. ;)

: SPREAD THE WORD! THE PRO-43 "A" models are NORTH AMERICAN REJECTS!! SPREAD
: IT FAR AND LOUD! THEY ARE RETURNS, REBUILT, REJECTS without full coverage.

: Tell tandy we will not settle for their second-hand north american censored
: GARBAGE! As far as I know Atlantic in Canada still can get them. If they can
: anyone should be able to.

In the November issue of DX Ontario, the magazine of the Ontario DX
association, there is an interview with the head of marketing for Radio
Shack in Canada, Mr. Dave Mayne.

Mr. Mayne makes it clear that while Radio Shack knows there are people
who are capable of unblocking cellular reception, they feel "obligated "
(his word, in quotes) to market radios that they feel confident are
blocked in the cellular bands.

New radios from Radio Shack to be introduced in Canada in the new year,
made by both GRE and Uniden, will have new technology to mask cellular
reception, including, in some cases, a new CPU. Radio Shack will not,
according to Mr. Mayne, be purchasing any more of the older stock. When
current stock is gone, it's GONE!

Radio Shack will be introducing a new radio in the spring of 1995 capable
of scanning 1200-1300 mhz.

I forsee a increase in price in "cellular capable", second hand PRO-43's
and bearcat 200XLT's in the days ahead... <g>

When I was in High School in NYC (quite a ways back in time) my friends and I
would often "cut" class to go down to Canal Street and Cortlandt Street. The
latter was nicknamed "radio row" since it was lined almost wall-to wall with
radio/electronics/parts/gadget stores. Most were stocked with world war II
surplus equipment such as transmitters and receivers removed from old combat
aircraft, mountains of parts, odds and ends, etc. We were solidly infatuated

with radio, electronics, in the pre-PC/Unix days.

Both Streets still exist in
Manhattan but radio row is gone, having been replaced by the world trade center
years ago, Canal Street's electronic stores are also gone, I believe the last
one closed.

5228. Trident TR4500 Scanner

Newsgroup: rec.radio.scanner
Date: 1994-11-10 12:47:23 UTC
From: smorgan@netcom.com
Message-ID: <smorganCz1y6z.C73@netcom.com>
Source record: 265729
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone have any opinion(s) on the Trident TR4500 scanner?

Basically, the product literature I was able to get from ACE Commo. says it covers 1-1300MHz, with some interesting verbiage about cellular lockout in the USA "except for Federal Government, Law Enforcement, or Cellular Providers" (which I take to mean that there is some simple modification to allow it to cover cellular for *ahem* others, as well). The TR4500 supports (get this) 2,016 channels. It only scans 38 channels or steps per second, but it has an RS-232 port and software allowing computer control, although I'm a little unclear as to the details of the computer control. (Software and computer-to-scanner cable is included.)

I'm somewhat confused how they can sell all of the above (and more, but I am too laazy to type it all in) for only US$469. Frankly, I am only interested if there is a mod for cellular (and a reversible mod would be twice as good). Is anyone out there aware of: (a) this manufacturer; (b) this unit; (c) an appropriate mod for cellular; and/or (d) the details of the computer control?

Thanks,

Source record: 265737

I happen to agree with Richard Crisps stands, he's one of an apparently small group that sees through the smoke screen we call Congress. His point to throw everyone out is justified in that the effect would be a strong message to the ruling officials who have no concerns for the average working American. He's hit the point head on, Democrat, Republican, they are the same side and support only their pockets. To blame any administration is ludicrous. While rebuilding our national defense, the predominantly Democratic Congress voted to export our commercial industry base to third world countries through tax perks. When the cold war ended and the nation tried to resume commercial interests, low and behold, the commercial manufacturing base was depleted and unable to support the present work force. Both Democrats and Republican alike profitted at the American public's expense.

What Richard has highlighted is plain as sun light to us. Each administration, both presidential and congress alike, is chipping away at our freedoms at an alarming rate. They are aware of the unrest of the people, they see the rising crime rates which are in large part a reflection of our economy, and their solution is to mute and manipulate the public through lies and promises that never materialize after the elections. Perhaps the next presidential candidate that supports a regular status report on how each elected official votes on issues will get more support at the booths. Obviously, many people have been 'snowed' into complacency, as is evident by the elections.

If everyone took as serious an interest in the government and issues as he does we wouldn't be wasting bandwidth here. What's the use of the freedom to complain if no one will execute their right to make a change?

Andy

Attn all MacHams!
Gallery's BBS has changed telephone number,we are now at 202-333-0407.
Our board specializes in Macintosh shareware for ham radio operators as
well other miscellaneous files for the Mac in general.
We got morse code pratice programs,packet tutorials,logging programs,rig
control and more cool Mac stuff online.
No charge for 30 min of daily access,call in using your favorite comms program.
DOS/Windows is also supported,but we need more files from our users.
VT100,RipTerm and NovaTerm support,9600 baud,24 hours a day.
Call it!

73's de N3MGA,Sysop

5237. Re: ECPA give you the right to listen to Police/Fire ?

Newsgroup: rec.radio.scanner
Date: 1994-11-10 15:39:38 UTC
From: ad607@FreeNet.Carleton.CA
Message-ID: <Cz2663.n34@freenet.carleton.ca>
Source record: 265742

In a previous article, rotnapple@aol.com (RotnApple) says:

>Could somebody with the complete text look this up for all of us?
>
>I thought the ECPA specifically stated, in the language of the
>bill that citizen were granted the RIGHT to listen to unencrypted
>(scrambled, encoded) communications of public safety agencies.
>
>I thought it when like ....Nothing in this legislation prohibits
>citizens from monitoring police, fire etc. Blah Blah, a free society
>to be able to monitor the workings of their public safety
>agencies..........
>
In reality it always was legal to monitor Public Service radio comms.
What ECPA did (under lobbying from the Phone Co.) was to restrict some
monitoring activity. So in reality ECPA did not take away the monitoring
of Public Safety services. It would appear the the ECPA is in affect in
Canada as well. Radio Shack is either not selling the Pro-43, just the
Pro-43A version. Shack also runs a scare campaign on their salesclerks
by threatening them with a $4,000.00 fine for telling anyone how to or
who will modify the Pro-2006 scanners to regain full coverage. So RS
in Canada is mandating the ECPA upon Canada, where by the Radio Act
IT IS LEGAL TO MONITOR ANY RADIO SIGNAL!!! But then Shack does sell
CelPhones!

"I wouldn't want to live in a society were the police didn't want you
to know what they were doing..."

The Democratic "Crime Bill" took another chip out of your
Constitutional right to bear arms. During the Clinton administration,
there was another bill to restrict the use of radar detectors
(basically a radio receiver) by certain truck drivers. It seems to
me that the Democrats are the anti-freedom, anti-liberty party;
it also seems that most voters agreed with me last Tuesday.

I think you can do much better than that. As far as "official" sources go, there's an "Airport Facility Directory" I believe, published by the FAA, which lists the Tower, ground, Unicom frequencies for every airport. You can pick up a copy in any FBO (Fixed Base Operator); your local flight school surely stocks 'em. They're quite cheap because they're updated very regularly. IFR sectional charts are interesting because they'll tell you what pilots are told, that is, which *specific* frequency to choose to call approach control for a given area, for instance. If you want to monitor *all* approach control frequencies, you have to go hunting all over the map to find what you're looking for.

There are books specifically dedicated to listing frequencies by state/city/airport, along with listings for things that are scattered on the charts, like ATC Center frequencies and local approach and departure control frequencies. Tom Kneidel (I probably misspelt his name, sorry) published a book I liked, and the classic "Montitor America" will tell you *LOTS* about frequencies on and around airports, including items like the airlines' internal communication frequencies, etc. Between those two I've found just about everything I've ever gone looking for.

You might try posting on groups like rec.aviation.misc as well.

Good luck,
-Patrick Penzias Dirks.

From: tham@fas.harvard.edu
Message-ID: <39tuvn$2h5@decaxp.harvard.edu>
Source record: 265753

I have a pro-2006 with OptoScan456 board installed. It has been working for a few months now without a glitch. I do notice there are noise coming out of the speaker when unit is turned on and in scanning mode. Level doesn't change with volume control. I know my BC200xlt also has some noise, but not as loud as the 2006 with 456 board. By no means it is very loud, but noticable when you sits within 5 feet of it. I haven't got a chance to call Optoelectronics engineers yet, but If you have similar problem or cure for that please e-mail or post.

Tnx,

Fu KA1NUB

WEll Joseph, all I'd like to do is get folks thinking about what they would
like to have the new Congress do for us. I think it makes sense to
put together a list of items we feel need their attention, and send it
to the new leadership as well as our own state's delegation.

I know many feel that the political stuff belongs someplace else
but thre are no radio politics newsgroups and if someone is willing
to start alt.radio.politics, I'd be happy to take the discussion there.

I would do it if I knew how, maybe someone will either do it or tell me
how.

But it is significant that Sri Lanka has elected a Socialist as has Japan.
Of course with Japan's recent political history, the PM will maybe last
another couple of months :-)

By the way I understand that the US Coast Guard has changed their
daytime frequency to 8983khz in case someone is looking for direct
radio content in this post and lacks the capability of seeing abstract
links.

Rather than just assume they will not, I submit it is better to tell them what we want and if they don;t deliver, then we know that we tried and that they aren't executing our will. If they aren't executing my will they don't get my vote in '96. This seems pretty plain to me, doesn't it seem that way to you?

daled@xetron.com (Dale Dickerhoof) asked:
> ... what frequencies the FAA uses to relay civil aircraft communications ...
Most remoted ATC sites use microwave or landline links to Center.

> ... frequencies allocated by the FCC to government agencies ...
Assignments for Federal government agencies are made by the National Telecommunications and Information Administration (NTIA) of the Commerce Dept., not the FCC. The NTIA Manual is available from the GPO as catalog nbr 903-008-00000-8, but I strongly doubt it includes specific frequencies.

Well, since the Internet originally grew out of the U.S. Defense
Department, guess which country has the most influence. If you don't
want to read it, you have a choice. Don't subscribe to the newsgroup or
skip to the next message.

Besides, politics plays a pivotal role in the scanning freedom of US
citizens. It certainly is relevant to me. I actually enjoy seeing other
people's views on how politics relates to scanning. Its t
hrough communication that we learn what's going on.

Hi,

Does anybody know how to modify the Pro-46 scanner for more memory channels?

I know this has been asked but I have not seen any posts on it..

John
jthompso@nermal.santarosa.edu

p.s. this is the generic, most often asked type of question....

It will if the recording is played loud enough into the phone. I've done it before when someone dialed a phone number onto my voicemail after the beep instead of during my outgoing message where they're supposed to...

:-)

I would like to add another question to the above post. If one were to add a center vertical element to the RS discone, would that severly upset the transmitting SWR at 2 meters?

>I have just received mail from a reliable source (I'll disclose that plus
>more information once I gain his permission to do so) that the Israel
>Broadcasting Authority has anounced the ending of all shortwave
>transmissions on January 1, 1995 unless the government provides finance.
>Once again I urge everyone to write not only to Kol Israel, but to the
>Israeli government that the shortwave broadcasts are important to give
>the world accurate news about Israel.

And while you are writing letters to governments, how about one to your congressman, one to each of your two senators and one to the president and one to the new speaker of the house and the new senate majority leader and ask them to introduce legislation that repeals the scanner ban of 92, repeals all radio monitoring prohibitions contained in the Digital Telephony Bill, and one that repeals the ban on cellphone listening contained in the ECPA86.

Remind them that an ordinary 10 year old TV can monitor cellular, remind them that cellphone security is easily achieved by using voice encryption,or digital cellular. Remind them that digital cellular will replace analog cellular due to market forces (they need more efficient spectum utilization), remind them that the US Federal Appeals court have determined that users of cordless telephones have no expectation of privacy since their transmission is unencrypted, and remind them that cellphone fraud is illegal without the DT bill and that it creates a dangerous legal structure where legitimate, non criminal use of radios and computers is in question.

Remind them that they are elected as agents to do the will of the people and without the will of the people that they have no job in 1996. Also remind them that the above mentioned list of items is our will.

I think it is far more important to take care of this critical constitutuional crisis at home than it is to attempt to pursuade a foriegn government to fund their shortwave broadcasts. Not that funding the shortwave broadcasts is not important too. Hell the money probably comes from the US aid to Israel anyway!

The original posting was sent to rec.radio.shortwave. In my opinion,
it was irrelevant to short wave radio listening, and that was my point.

I can accept that it was germane to scanners, so it was appropriate to post
it on a scanner newsgroup. Putting it into rec.radio.shortwave was just
another case of inconsiderate spamming. The shortwave newsgroup is
intrisically international, and its stated purpose is radios. There were
many recent postings that polluted rrs and which were purely related to
US politics(sometimes only northern California) and with no relationship
to shortwave radio(not even containing the childish afterthoughts that
have recently appeared). I had foolishly hoped that those might disapppear
from rec.radio.shortwave until at least the next election was close.

BTW, the reference to the Japanese electoral reforms was not about the
party in power, but in the change in the allocation of the districts
represented in the Diet. To this outsider, it appears to me to be more
revolutionary than the decennial redistricting in the US.

Very interesting story - I didn't know that that's what R.E.M. was singing about. I always figured that R.E.M. should've posted a note on rec.radio.scanner asking for whatever frequency they were looking for - that way, we would have been spared from Michael Stipe's whining of the rest of the song. (What? He's _singing?_ :))

: I'am looking for the helmet radio frequencies in particular
: but I will take all.

According to one of the most recent Monitoring Times, the helmet radios use digital encryption. This is presumably to keep other teams from listening in.

The magazine goes on to tell how the Cleveland Browns tried a radio setup in a 1959 game against the Giants. The Browns got an FCC license, the Giants got ahold of the frequency, and by listening in were able to hold the Browns scoreless in the first half. Then the radio conked out and the Browns went on to win.

Or something like that (from memory - I flipped through it at the bookstore).

I can see why you put it into alt.radio.scanner, but why did you put it into
rec.radio.shortwave where it has no obvious relevance?

I guess you do not listen to NHK. Otherwise, you might know something about
the recent electoral reforms that are expected to shift political power from
the rural areas to the cities. It was also covered in the news on VOA and

Radio Singapore International.

>Is it possible to monitor one of these with another phone of
>the same model? Do all production-units use similar spread spectrum
>"patterns," or algorithms when tramsmitting to and from the base unit?

The unit uses Frequency Hopping (not direct sequence) SS and I
could easily watch it hop around using a spectrum analyzer.
(A $15,000 model from IFR. Ouch!!)

I expect ALL units have a frequency look-up table of sorts
but the starting point may be determined randomly and
even changed on the fly if interference is detected.

So the answer is NO, you could not EASILY monitor with
another model. One of the reasons for using SS is to get
around the problem of intererence and interception that
is typical of the 46/49MHz narrow-band cordless phones.

>Does anybody have a list of CELL-Phone Freqs?? I see them all the time

What do you need specific frequencies for? All you need to do is a limited search between 823 and 851 mhz for the handset, and 869 and 896 mhz for the towers. They transmit at 30mhz intervals, and transmissions are scattered between the higher and lower limits. Its much more effective to just search the range, than to program in the freqs.

5276. TRADE: BC-2500-XLT for PRO-2006

Newsgroup: rec.radio.scanner
Date: 1994-11-11 02:48:14 UTC
From: schroederk@rcwusr.bp.com
Message-ID: <1994Nov10.214814.1264@rcwusr>
Source record: 265787

Thanks for reading. I recently have been bitten by the computer controlled scanning "bug". I would like to get a pro 2006 once more. (Had one a few years ago, and sold it.) I have a BC2500 XLT handheld scanner I would like to offer in trade. For those who may not be familiar with this scanner:

400 channels
Wide frequency coverage
approx. 100 channel / second scan and search rate
Search and store function is built in. (Great for finding unknown frequencies during unattended operation)
Hit counter function built in. (After you store all of your new-found frequencies using the search and store mode, you can scan them and see just how active they are. Also great for unattended monitoring!)
Very sensitive receiver
Best backlit display I have seen in a handheld
etc., etc.....

As frequent readers of this group may know, in high signal strength areas, this handheld may receive images and or intermod, however, in other areas, this thing is a screamer!

Also, it has been modified to receive the forbidden cellular frequencies by an avionics tech.
Includes carrying case, charger, manual, and one nicad pack.

If you are at all interested, please e-mail me at:

schroekt@clipo1.usachem.msnet.bp.com (or just reply to this) at schroederk@rcwusr.bp.com

Thanks again. Kevin Schroeder

Good news, Charlie -- I've already done one for someone in your area.
Yes, there are many interesting transmitter sites there, but my
dithering algorithm works pretty well at avoiding clutter.

Although the Schaumburg area has a lot of transmitters, there
is a higher transmitter density in the Chicago Loop and
downtown Manhattan -- two areas for which I've already made
RadioMaps for folks.

5284. Cellular or cordless in 400MHz range?

Newsgroup: rec.radio.scanner
Date: 1994-11-11 07:27:59 UTC
From: radix@pentagon.io.com
Message-ID: <$fmmkWPq5TcS073yn@pentagon.io.com>
Source record: 265792

While using the search mode on my old pro-2021, I came across what appeared to be telephone calls in the 400-500MHz range (not sure exactly what freqs, this was a few days ago...). Just out of curiosity, was this cellular, cordless, or what? I was under the impression that cellular was limited to the 800MHz range, and cordless to the ~40 (I think...) and 900 ranges, and haven't ever heard of either in the 400MHz range.

: Where would such a database reside?

: Thanks,
: DD

I've been a controller 30 years and I don't know what you mean. Remote aircraft transmissions are relayed to centers and FSS's by way of telephone lines and microwave link; otherwise its 118-136 Mhz for civil aircraft.

5287. AOR 8000

Newsgroup: rec.radio.scanner
Date: 1994-11-11 10:41:21 UTC
From: Victor Healey <vhealey@crl.com>
Message-ID: <39vhoh$qlc@nntp.crl.com>
Source record: 265784

If anyone has one of these AOR 8000 scanners I would like to buy
a phocopy of the manual from you. If the copy is clear enough
perhaps I could scan the essential parts inot electronic form
so others can read the same information I am seeking to
determine if this scanner is worth purchasing.

Has anyone purchased the computer interface yet? I am interested in
the docs to that also.

How easy is it to swap out the batteries to this thing?

Vic

>"patterns," or algorithms when transmitting to and from the base unit?

I'm not familiar with the Uniden 900 MHz phone. Does it employ
direct sequence spread spectrum or frequency hopping? How fast is
the hop?

I wonder if using an Interceptor (without rescan delay)
would be quick enough to follow a (slow) frequency hopping signal?

Just to brainstorm for a moment.... How about a different
strategy than trying to "follow" a hopping signal -- listen
to the entire band (e.g. 902-928 MHz) at one time instead?

For close-in work, how about using a comb generator/local
oscillator configuration on a receiver outfitted with a 902-928 MHz
front end filter? That would let you listen to the entire band
at one time.

The downside would be that you couldn't separate other radio
activity within the same bandpass. Another nit is that the
signal you want to receive may be below the noise aggregate level.

I encourage radio tinkerers to experiment and report back.

Source record: 265791

Help... How do I get freq I received in the search mode into
the grouping mode ?? Manually ?? You've got to be kidding.
Is the only way to load the group files , manual ?

Also Does anyone out there have any user written software to
run there Opto board w/2006, The 3.44 ScanStar is ok but
wasn't what I had expected.

Anyone have the 3.44 Professional they'd want to sell ?

Does any one know of any other packages besides (Probe,ScanCat)
for the Opto 456 w/2006 ?

Does anyone know what the f7-RALL key is supposed to do?

Any help would be appreciated, Thanks.

Richard Reider

Sorry Richard, I don't think they'll budge, they are mostly Republicans and they will be even in more support of the telephony industries lobbies. Worth a try, even if just to 'test the waters'. The effort would have more of an effect if the scanner manufacturers lead the move.

Andy

>Where would such a database reside?

Federal frequencies are coordinated through IRAC, not FCC.
The entire IRAC frequency list was classified during the
Reagan administration.

In one of the scanner FAQs I write:

| Federal Radio Stations - Not Licensed by FCC

|Since federal government radio stations are not licensed by
|the FCC, they are not listed in FCC microfiche. In 1981, a
|group of 60 radio hobbyists split a $1300 fee, and obtained
|80 microfiche cards of 'sanitized' information about
|federal government radio stations under the Freedom of
|Information Act (FOIA)1. Only 12 of the 21 information
|fields for each station were furnished. Fields like
|"Remarks", which indicate the exact usage of a channel
|(e.g. "Sky Marshall's Net"), and "Bureau", indicating
|agency subdivision (e.g. TAC within the USAF), were
|withheld. These 80 pages of microfiche were sold by Grove
|Enterprises for $25, but are no longer available from that
|source. Private entrepreneurs have been known to ask $125
|or more for a set! In a step backward, the US Government
|insists it will no longer release this type of information
|- it is now 'classified'2.

|For a reason unknown to this author, the government
|released a 1984 vintage set of frequencies allocated to the
|FAA. Perhaps this was a mistake, because the information
|is marked 'unclassified', but all fields are furnished,
|including some which indicate security related usage.
|Grove sold this set of 33 microfiche cards for about $13.

|1. See "The Government Giveth, the Government Taketh Away",
| by Richard Prelinger, in Monitoring Times, July 1982.

|2. See "AFIO and the FOIA", by Bob Grove, in Monitoring
| Times, September 1982.

Another reason is that a strong FM signal "captures" the receiver so that a weaker station cannot be heard. AM has the ability to receive two stations simultaneously. Air traffic control can easily detect two aircraft transmitting simultaneously.

Personal attacks against those that don't agree with you? Who's the
fascist?

No, you obviously don't understand the meaning of fascist since that
is what we are trying to prevent but what we are facing in government
today.

^^

What have you got to hide? You should be concerned with the government
monitoring your activities. I know, I worked as a communications
consultant in surveillance for an agency.

anubis@luxor.csuohio.edu (Gregory Stark) asked:
> Does anybody have a list of CELL-Phone Freqs??

From the FAF - Frequently Asked Frequencies file on oak.oakland.edu -

---

Cellular Telephone

Chs Freqs (base) System

800-832 869.040 - 870.000 RCC - voice
1-312 870.030 - 879.360 RCC - voice
313-333 879.390 - 879.990 RCC - data
334-354 880.020 - 880.620 Telco - data
355-666 880.650 - 889.980 Telco - voice
667-716 890.010 - 891.480 RCC - voice
717-799 891.510 - 893.970 Telco - voice

Mobiles transmit 45 MHz below the base (824.040-848.970) and
are usually repeated by the base. Channels are .030 MHz apart.

I found a GREAT! scanner freq book for the STL area:

The Black Book of Scanner Frequencies

Owl's Nest Publications
P.O. Box 387
Granite City, Il 62040

It has all of the Commercial and Government Stuff from the area.

I bought it at Gateway Electronics on Page Ave. in STL for $15
(314) 427-6116

I posted this when the R7100 first appeared a year or so ago:

COMPARING THE ICOM R7100 TO THE R7000 RECEIVER

Copyright 1993, 1994 by Bob Parnass, AJ9S

The radio RF/IF/AF portions of the R7100 are similar to the
older R7000, but the R7100 is constructed using surface
mount parts. Consequently, the R7100 is smaller. A-B tests
indicate both the R7100 and Radio Shack PRO-2006 receivers
are about equally sensitive, and more sensitive than the 6
year old R7000. Both the R7000 and R7100 are much more
immune to intermod than the Uniden/Bearcat 760XLT and the
portable PRO-43.

Many of the functions controlled by separate rotary switches
and potentiometers in the R7000 are controlled by pushbutton
switches and firmware in the R7100.

Deleted Tuning Meter, Added AFC

Too bad the R7000's analog center reading meter function was
replaced with 3 indicators on the R7100, a left arrow, a
square, and a right arrow. In my R7100, the square lights
if you are tuned within 2.5 kHz of center of an FM station,
a larger window for WBFM signals. The arrow indicates the
direction in which the tuning knob should turned to center
the receiver on the signal.

The R7100 has an interesting AFC circuit, controlled by a
front panel switch. The AFC will automagically tune the
receiver close to the center frequency if you tune near an
FM signal. You can watch the frequency change as the AFC
steps the receiver in 100 Hz increments (on NBFM). The AFC
never quite tunes to the exact center, but tunes within a
window set by a difference amplifier circuit, so the station
sounds good even though the R7100 is slightly off center
frequency.

Modes

R7000 and R7100 users have the same choice of modes, but they are easily selected from front panels controls in the new R7100. A rear mounted slide switch is used for USB/LSB selection in the R7000.

Fancy Firmware for Memory Organization and Scanning

The firmware in the R7100 is much more sophisticated, and a brief article wouldn't do it justice. There are 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. There are many possible ways to scan, more than listed here. You can scan:

all channels
all channels in a given bank
all channels in a given group
all channels in a given group in a given bank

all channels in a given emission mode
all channels in a given emission mode in a given bank

As with most other scanners, there is a lockout bit for each channel, so you don't have to scan the NOAA weather channel even though you have it in memory.

There are 10 pairs of search limits. The search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. I used this for searching for federal stations in the 162-170 MHz range while skipping the NOAA weather channels 162.55, 162.4, and 162.475 MHz, as well as some veteran's hospital paging channels.

The R7100 has 2 VFOs, but Icom calls them windows. There are several window scan modes, but they resemble priority scan modes in a Bearcat scanner.

Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Perhaps a bigger drawback is that both the R7100 and R7000 employs a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

New Memory Query Feature

The R7100, like the Bearcat 200xlt, has a feature which allows you to detect memory channels programmed with duplicate frequencies.

Tuning Step Selections

The R7000 tuning step size is selected using a rotary switch. The R7100 tuning step size is selected by using a pushbutton to step through the selections. The R7100 has more choices, including a 100 kHz step, useful for tuning around the aircraft bands.

Another new R7100 feature is that a tuning step size can be stored into each of the 900 memory channels, so when you use the tuning knob to tune off a memory channel, the R7100 tunes in reasonable increments (e.g., 12.5 kHz in the 450 MHz range, 10 kHz in the VHF-low band, etc.).

Rescan Delay Added, but Nondefeatable

Icom finally included a decent 2 second rescan delay in the R7100 which owners complained was missing from the R7000. Ironically, you cannot defeat the rescan delay in the R7100, so it's now more difficult to scan trunked systems in which the frequency changes with each new repeater transmission! Using the VSC voice squelch helps shorten the rescan delay unless scanning noisy stations.

Power Supply and More

The internal power supply in both radios runs hot. The R7100 comes with a 12 VDC power cord included, an option in the R7000.

The R7000 comes with a handy carrying handle and rubber feet, an $8.50 option on the R7100.

Added Clock and Timers

Unlike the R7000, the R7100 contains a digital clock and timers which can be used to turn the radio on and off, and tune to different channels, several times each day. I probably won't be using timers, though.

Which Radio to Buy

For fast, reliable scanning, you still can't beat a PRO-2006. If you want SSB reception, computer control, or a radio with a tuning knob and lots of features, I recommend the Icom radios.

The R7100 is more complicated to use than the R7000. There are so many firmware controlled features and there are several 2 key sequencies.

Faced with choosing between an R7000 or an R7100 in a similar price range, I prefer the newer R7100. Sensitivity aside, both are about equal communications receivers, but the R7100 is a better scanner, especially for finding new frequencies and organizing memory.

Like everyone who has started somewhere I am new to this newsgroup. I own a Radio Shack Pro-32, apparently not such a hot model, since there are no postings here about it ! I did buy a converter from a mail order scanner shop and i can get cellular if I want to. Kinda slick downconverter that works fine for me. Some verrry interesting conversations about cracker crumbs in bed...

Anyway, as long I have been interested in scanners, I have found that there is one feature I would like to have in a scanner. These 200 and 400 channel units are great, but the display is all numbers. I would expect that the technology allows for this possibility, if not, clue me in: Why not an option to enter a few characters to identify each channel? You had to enter in the freq in many cases and even if you don't know exactly what you are hearing, you can make a note. Instead of 27 - 154.575, you could have 27 - TACBELDU or something like that, eh?

After reading the hundreds of posts here, I can't wait to listen to the local eateries conversations. Well, yes, I think I can, but there will be some novelty for sure.

Now folks, if there is a scanner out here with the capability to display letters instead of freqs, by all means, tell me!

Another question, what are the comments I scanned by about connecting a pc to a scanner? I am afraid that I skimmed by too fast on those, looking for comments on my pro-32.

I have put several in attics and have some general advice.

Don't do it on a hot day. Watch where you put your feet. Watch your eyes with the antenna. Preassemble the antenna as much as you can to minimize the chances of dropping a microscopic screw in the insulation. Try to have the hole in a closet if possible.

It's usually easier to feed the cable up than down, which is unfortunate, since if you could do it the other way, more preassembly might be possible. Measure for the cable length, allowing for routing in corners, behind furniture, etc., and allow a few extra feet. Allow also for positioning the antenna in the attic away from ducts and so forth as much as possible. Have it all laid out in your mind before you go up there to put it in.

I would recommend getting one with the vertical element, if you get a discone.

Hello-

I think a few people are missing a very important point I wanted to make here.

We prevously have been able to monitor police/fire becaused it was NOT prohibited.

The ECPA specifically points out in it's language that we HAVE THE RIGHT to do so.

The difference could mean a great deal to somebody trying to convince a law enforcement agency of the legality of their monitoring. We still have newbies and friends who ask "can you listen to them, isn't that illegal". Instead of trying to convince them that since it wasn't stated you couldn't monitor you can. ECPA says in black in white yes you can!

Greg

Maybe you are right. Or maybe seeing how easily they can be thrown out of office will make *all* politicians more responsive to citizens who care enough to write.
I say Richard is right, we are talking about politicians. They will sway which everway the pressure is coming from. The more organized we are the better.
Or we can lie down and get squashed and then bitch about it.

Chris,
Whether or not people monitoring police radio traffic can prevent abuse of
police power, it is interesting to know that MDT transmissions can be
intercepted and displayed or printed. For less then US$2000. you can put the
system together. You can also do the same with alpha-numeric pager
transmissions. Of course, that is illegal.

[Posted on 11 Nov 1994 21:58:30 GMT]

FOR SALE : Radio Shack Pro-2006 400 Channel Scanner

This is a "new" unmodified Pro-2006 complete with original box, manual and receipt. It is about 2 months old, still under warranty, and in perfect shape. I am selling it because I need funds for a new project.

Asking $295.00 and the buyer pays shipping charges.

Also, I will include a RS telescoping BNC mount antenna with 90 degree adapter.

Regards,

Brent Mirchandani KB0LUE
bjm@cs.itc.hp.com

radix@pentagon.io.com (Sikkid) asked about:
> ... what appeared to be telephone calls in the 400-500MHz range ...

You'll have to be a bit more precise <g>. Possibilities include -

Mobile Telephone Base: 454.025 - 454.650
(25 kHz spacing) Mobile: 459.025 - 459.650

Air to Ground Telephone Ground: 454.675 - 454.950
(FM, 50 kHz spacing) Airborne: 459.675 - 459.950

Elsewhere in the 450-470 MHz range you would have heard a 'phone patch',
where a mobile service repeater has a link to the phone system. In the
420-450 MHz range it would be amateur operators with patch capability.
In the 470-500 range, you were listening to a call-in TV show <g>.

A strong AM signal can capture a weaker AM or FM signal. Aircraft comm is A3E or AM with carrier. Unmodulated carriers are the same from an FM or AM radio. When modulated there still isn't enough difference between AM and FM to make capture a concern.

I fly regularly (as I am sure others here do also) and can tell you that when two stations key together you hear either the stonger station that captures or the squealing of hetrodyne. It is easy to detect two stations transmitting simultaneously with FM also - the het sounds different but it's still there.

Thomas' explaination is the more pratical. The "capture" issue is often cited as the reason but its never held much credibilty with me. If it really was an issue why wouldn't public safety be using AM? They don't - and dispatchers can still usually tell when multiple units transmit.

> Thanks!

Since there has been quite a few posts wanting this data, here is a
list of fast food frequencies that is listed in the November issue of
Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies
to every fast food chain for their own use, and that any fast food
restaurant can buy whatever low powered FM transmitters / receivers
they need for their store at an electronics shop. Anyway, just stick
the below in one of your scanner's channel banks, and see what comes
up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

Hardee's 30.84 31.00 35.02
151.685 151.805 464.0125
469.0125

Kentucky Fried Chicken 31.00 170.305 457.5375
457.5875

Taco Bell 30.84 154.57 465.8875

Wendy's 33.16 33.40 154.515

Burger King 30.84 457.55 465.8875
467.775

5321. Help: Increase reception

I have a portable scanner I received as a gift (Uniden Sportcat). I primarily want to listen to the aircraft band. The help I need is to increase the reception. With the regular antenna, I have to be within a mile to hear the tower and aircraft on the ground. I'm hoping to be able to receive as far as 20 miles. Is this hopeless?

Thanks in advance,

-ds

There are full duplex, radiotelephone applications that run in the 400-500
range. Some are for rural (really rural) telephone services where there are
no telco facilities. Others are just commercial land mobile. I have been
told there are UHF (400-500) "airphone" operations - you may have been hearing
a phone call from an airliner.

From: David Gustafson <davgus@delphi.com>
Message-ID: <x2328YT.davgus@delphi.com>
Source record: 265818

I want to get a handheld scanner before the easily mod-able ones are
no longer being sold, but I dont know much about them. I have heard
lots of good things about the Radio Shack ones so I have decided on
one of them. I dont really want to spend the $349.99 on the pro-43,
is it really worth the money? or should I just get one of the
$299.99 models like the pro-51 or pro-62? I guess what I really
need is for somebody to make a list of Radio Shack handhelds from
best to worst (meaning most hackable, I wanna hear it all) including
the models not in the '95 catalog because the store I plan to
buy it from has a lot of handhelds overstocked from previous years.
Also, is there a place I can buy discounted radio shack scanners
from? I heard about a place in texas that sells radio shack stuff
cheap but I havent called yet. Any help will be greatly appreciated.
Thanks,
-Dave

Any suggestions for a good desktop shortwave radio. Something that I can neatly stack below or above my RS PRO-2006 scanner. Minimum requirements are digital, BFO, 150 khz - 30.000 Mhz, and fairly good sensitivity. Also, since I'm not made of money, it has to be below $1,000, but would prefer it even be below $500.00.

The wiretap bill doesn't prevent you from speaking freely. On the other hand, yes, it's been clear to me all along that the 1st amendment protects my right to "speak" in any "language" I choose... even if that language isn't intelligible to the guy listening in.

If I speak 9th C. Anglo-Saxon on an unencrypted line, the average G-man (or jury member, for that matter) isn't going to make much out of it. What are they going to do -- pass a law requiring everyone to speak in short English sentences, carefully pronounced? Same thing if I speak 20th C. English, but filtered through a (non-Clipper) chip, as far as I can tell....

I bought an Pro-2035 so I a getting rid of my Pro-2021 scanner

Description below:

Radio Shack Scanner: Pro 2021 $150 plus s/h

Realistic Pro-2021
VHF/UHF Direct Entry Programmable 200 Channel Scanner Radio

This programmable radio is in excellent condition, yes fully functional.

You'll have access to over 23,000 frequencies!

Features include:

o Ten 20-channel memory banks
o One 10-channel monitor bank for temporary storage and priority freqs
o Rapid transfer from Monitor to Permanent Memory
o Large multi-purpose LCD shows which channels and frequencies are being
scanned, monitored, programmed, as well as the status of the channel
and operation mode of the PRO-2021.
o Provides optional two-second delay to eliminate missed replies on
any channel.
o Holds memorized frequencies with internal 9-volt battery backup

o Covers 30-50 MHz (VHF Lo)
50-54 MHz (ham radio 6m)
108-136 MHz (aircraft)
138-144 MHz (government)
144-148 MHz (ham radio 2m)
148-174 MHz (VHF Hi)
380-450 MHz (ham radio and government)
450-470 MHz (UHF Lo)
470-512 MHz (UHF Hi)
o Built-in internal speaker
o External speaker jack
o BNC external antenna connector
o 120-volt AC operation with power cord
o 12-volt DC power jack for automobiles and RVs (negative ground)

Mobile mounting bracket can be purchased at your local Radio Shack store.

Includes owner's manual and telescopic antenna.

Price: $150 plus s/h

If interested just email to jamesb@clark.net or
you can call at (410)969-7676.

If not home just leave msg on machine and I will return your call.

>appreciated.
>
> Jeff
> jschribr@cts.com

Go with the Grove discone, it'll outperform the RS antenna due to
the extra element. I use the RS multiband vertical in my attic and it
works great. I live on a hilltop, so that helps too.

The red and green pairing is correct. Interesting story on the reason
for reverse voltages. To keep it short, the reason for reverse voltage is
that corrosion doesn't develop on the wiring.

I understand that when you receive with your walkman at 88MHz, it is
transmitting about ten MHz above 88 (or whatever it is for your radio)
which (in theory) would be 98.0 . If you listen to 108.0, it would be
118.0 which is the aircraft's frequencies. My question: why do radio's
transmit like that?

GL> If it's microphonic when tapping on the cabinett it indicates that
GL> it's generated by some LC-circuit in the radio.

Hi, Goeran...

When I used to own the '34, I remember having a problem in the 800 Mhz region. When the volume was turned up, I would get a howl during the transmission. Somehow, the sound was feeding back into the oscillation circuits to create the howl. After taking apart, I tapped around on the radio and found exactly what you described, a microphonic sound in one of the coils. Slipped a piece of foam on it and solved the problem.

What do you like to listen to out there in Sweden?

Jerry

Hi, Chris...
Can't find the article that was in Monitoring Times on this, but it is basically used by airplanes. It is a form of data that is sent between the plane and the tower. You may hear some signals in the 130 to 131 range, I believe.

Since the author of the book still sits as a federal prisoner in a
Ft. Lauderdale jail (it's been 2 months, and still no bond has been set,
lots of things have happened since the original dumpster arrest), I
doubt that there are many issues around to be purchased. Even if/when
he gets out, the feds took all of his computers, and the files kept
with them, and they included all of the information and files used to
publish the book so it will be a long time before there could ever be
a new update of the book.

Here are the mods I have that I ftp'd from oak.oakland.edu:

From: rats@ihlpm.UUCP

PRO-2006 Modifications

NOTE: The Electronic Communications Privacy Act of 1986 makes it
unlawful to monitor mobile telephones, including cellular. The following
modification is intended only to restore continuous 760-1300 MHz
coverage as originally provided by the design of the PRO-2006
microprocessor.

BE SURE TO TEST YOUR PRO-2006 FULLY BEFORE ATTEMPTING THIS
MODIFICATION. ANY MODIFICATION MAY VOID YOUR WARRENTY.

824-851, 869-896 MHz Frequency Restoration

Tools Required: small Phillips screwdriver, small wire cutters.

Procedure: With the power cord unplugged, remove the two rear
cabinet screws holding the upper cover. Lift off the upper cover,
being careful not to stretch the speaker leads. Examine the inner,
right-hand-corner of the front panel to find two glass diodes, labelled
D503 (upper diode) and D502 (lower diode).

Using the clippers, very carefully snip the visible lead of the lower
diode (D502) at its bend and slightly separate the cut ends. If it is
ever necessary to send the radio back for warrenty repair, the diode
leads should be carefully resoldered.

Reassemble, plug in AC cord, turn on scanner, and press RESET.

Keyboard Beep Delete

With the top cover removed as described above, locate connector CN3,
a 15-pin connector with colored wires at the front of the main circuit
board. There are two precedures which will stop the beep tone from

being heard through the speaker; read both to decide which procedure you want to follow.

(1) Find the center grey wire coming from CN3 and cut it midway to disable the beep tone. You may wish to solder a resistor in series to reduce the beep volume, a trimpot to vary the volume of the beep tone, or a minature switch to choose between beep and no beep.

(or)

(2) Using a pair of needle-nose pliers, CAREFULLY pry the plug from CN3, revealing a row of pins. Locate the center pin (#8) which corresponds to the grey wire and bend it down flat, disabling the beep circuit. Reinsert the plug. The pin may be erected again later to restore the beep tone if desired.

This completes the restoration procedure. Reattach the cover and replace the screws.

WARRANTY REPAIR

Should it be necessary during the first year of ownership of your new PRO-2006 to exercise your warrenty, it should be carefully double-boxed (as you received it) and returned to Grove Enterprises. Be sure to include a copy of the original bill to establish warranty privileges.

You must prepay only shipping and insurance; return shipping and insurance to you will be paid by the dealer.

Grove Enterprises, P.O. Box 98, 140 Dogbranch Road
Brasstown, NC; 1-704-837-9200

|> Any side-effect? A guy from Marymac told me the mod
|> increases scanning speed significantly.
|> nvn

There are two diodes behind the "3" key on the keypad.
Clipping one restores cellular, clipping the other
increases scan speed by about 13%. I did this to my
Pro-2006 after the warranty expired and did indeed measure
a 13% scan and search speed increase. I don't think
this has had any adverse effects on the radio although
its theoretically possible that the increased scan speed
might cause the radio to miss some carriers - but this
is purly speculation on my part.

Cheers,
Peter

>Cheek), it is theoretically possible to increase the Pro-2006 in the same
>manner, although he warns that he hasn't personally tried it. Since it
>already scans *much* faster than the 2004/5 (Hyperscan) with a 12 MHz
>crystal, he cautions that it may or may not work. HAS ANYONE TRIED A
>CRYSTAL FASTER THAN 12 MHZ IN THE PRO-2006?

Yes, I have done the Crystal mod. I used a 16.630 MHz crystal from an old
cordless phone (no bull), and I got a big speed increase (approx. 46 channels
per second). I tried several different crystals, ranging from 16MHz to 39MHz,
and my results seem to indicate that the highest crystal freq. should be about
18 MHz. If the crystal is too fast, the 2006 just uses the 3rd harmonic (ie
a 39MHz crystal operates like a 13Mhz.)

From: ross@novax.llnl.gov

>The Scanner Mod Handbook #2 says to replace the 12 MHz crystal with something
>>faster; however, the author, Bill Cheek, says he hasn't actually tried it. I
>>haven't either, although I'd be interested in knowing if it is a successful
>>mod.
>

Welgang, right after I got my Mod handbook 2, I tore into my 2006. At first I
tried a 20 MHz xtal, the processor locked up and not all the LCD display
segments were happy (I had already done the diode clip speed mod). So I tried
an 18 MHz xtal, same problems. I contacted Cheek (the author) and he reported
that 16 MHz was the safe upper limit as he had seen no lockups at that speed
and higher speeds had produced lockups on SOME units.

So I changed xtals again. The 16 MHz runs fine without any loss of sensitivity
and I find enough delay left to still be able to use it (a faster
microprocessor xtal shortens delay time).

My favorite 2006 mod is a wired remote control (Monitoring Times Aug 91 - Bill
Cheek). I added a few extra parts and can control the following functions from
~~~~~~

a sixfoot detachable cord: Scan, Manual, Search up, and Search down. Searching is a snap when you can't reach the keyboard or it is dark.

Gary

From: IN%"horak@eugene.convex.com" 7-NOV-1992 11:49:43.95
From: horak@eugene.convex.com (David Horak)
Subject: RE: PRO-2006 Scanning Speed Mod.

Well, I changed the crystal in my Pro34, which is the same type of crystal and harder to get to than the 2006; however, I haven't changed the 2006 crystal yet. Some of the following instructions come from the Scanner Mod Handbook Vol. 2 on removing the logic board. Please read it all before doing anything. If you royally screw up your scanner, IT IS NOT MY FAULT!!!!!

Before you start anything, make sure you are at a static safe workstation. Unplug the A/C power cord. Remove the top and bottom covers. Remove the 4 countersunk machine screws from thesides of the front panel, then gently pull the panel away from the main chassis. All wires and cables will have to be disconnected from the top and bottom of the logic board (the board that the crystal is on). This will cause your memory channels to be lost and you will have to reprogram them :-((If you can work around it, you could leave CN-3, a 15 wire connector, connected to save your memories). At this point you may have to desolder a ground wire from the chasses going to the bottom of the logic board metal shield. Next, remove 6 small screws that secure the logic board to the front panel. Then, face the inside of the front panel placed in an upright position and locate the white 13-pin connector (CN-501) at the upper left corner of the board. This connector doesn't have any wires, just metal pins going into it. Gently pry this connector apart with a small flat blade screwdriver and the board should slip away from the plastic front panel and come loose in your hand. Also, you may need to remove the volume and squelch knobs. Desolder the metal shield at six places around the logic board and lift it up and off the board. This is fairly easy to do with a low wattage soldering iron. Apply pressure with your fingers while the shield is heated at each leg. As the solder melts, that leg of the shield will slip upward and pop free. Now there are two choices. If you have an air sucking soldering iron, you can procede to desolder each of the three leads. If you have a normal iron, this will be impossible. The remaining choice is to crush the crystal with a pair of needle-nose pliars until only three leads remain sticking up off the board. Then you can heat and remove each of the three leads. The center lead is ground. You will only use the outer two leads when installing the new crystal. It would be a good idea to insulate the body of the crystal with shrink tubing (whatever you do, don't use electrical tape!) to avoid it shorting out to another component. The crystal will have to be bent over so that the metal shield can fit back on top of the logic board. Before you completely hook everything back together, get the

scanner in a usable state and make sure it works. It would be a real bummer to tear it all apart because something is wrong.

Hope this helps,

David

alt.radio.scanner
Subject: Pro2005/6 SSB MOD HERE!
From: horak@convex.com (David Horak)
Date: Mon, 31 May 1993 18:04:59 GMT

I had a few requests for this mod so I thought everyone would benefit...

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able

to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the signal well!

If you don't succeed or this description has you baffled you probably shouldn't be doing the mod in the first place. I assume no responsibility for screwups. Good luck

David

5355. Improve the Squelch in Your Monitor Receiver

Newsgroup: rec.radio.scanner

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of | the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Bearcat 800XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. Unfortunately, the Uniden/Bearcat 600XLT and 760XLT series use tiny surface mount components, which makes modification very difficult. I've successfully reduced the squelch hysteresis on other models by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is,

and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, | MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers			
Receiver Model	Designation	Resistor Value	Factory Comments
Radio Shack PRO-24	R35	33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K	try 220K.
Radio Shack PRO-2004	R148	47K	remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)
Radio Shack PRO-2022		33K	replace 33K with 220K. Between pins 12 & 14 on IC-1 MC3361

Bearcat 220	R75 2.7M may be ok as is
Bearcat 20/20	R75 2.7M may be ok as is

Selling GRE Super Converter II handheld/base scanner converter. Converts full, UNRESTRICTED 800-912Mhz to your 400-512Mhz capable scanner. Uses existing antenna, has bypass switch, and runs off 9V battery. Works excellent. I now have three 800Mhz capable scanners and no longer need the converter. Mounts right on top of handheld scanner or behind base scanner.

$60 includes shipping.

E-mail if interested.

Andy

5358. Scramblings??

Hello everyone,

This summer, we had a shooting at a gas station here. I saw it on TV
and flipped the scanner on. They were still investigating but their
transmissions were garbled.. Sorta like sideband. Anyone out there know what
this "scrambling" method is? thanks N0ZYA

: appeared to be telephone calls in the 400-500MHz range (not sure exactly
: what freqs, this was a few days ago...). Just out of curiosity, was this
: cellular, cordless, or what? I was under the impression that cellular
: was limited to the 800MHz range, and cordless to the ~40 (I think...) and
: 900 ranges, and haven't ever heard of either in the 400MHz range.

What you most likely heard were older-style mobile radiotelephones, used in the B.C. (Before Cellular) era. There's also frequencies in the 152 MHz area for them (those can also be used for pagers).

Or maybe even a ham phone patch. Or business radio phone patches. Or private aircraft phones. Lotsa possibilities between 400-500 MHz.

You can call your local FAA office for specific Airport frequencies and Center frequencies. If you get the Tower's frequencies, (note the plural), you can hear the tower give other frequencies for ground and departure and Center frequencies. You can also post your question to rec.aviation.misc for your area. I can get you frequencies for the NW FAA Region (WA OR ID MT WY CO UT)

>

I don't understand your reference to a Co-Op in this context. Utilizing a Co-Op does not force you to sign a service agreement with it. If you can find better prices, you are quite free to go to the other provider to obtain those services or goods. This applies in all of my dealings with Co-Ops, whether they are providing groceries (in Hyde Park, Chicago), heating and motor fuel (Antelope County, Nebraska), and books (Hyde Park, Chicago). In all of these cases, if I am a member of the Co-Op and I purchase something from them, I receive a rebate at the end of the fiscal year (if I meet some set level of purchasing). However, if I comparative shop and find a better price, I am free to purchase the item or service from the other provider. And I don't have to be a member of the Co-Op to shop at a Co-Op. Cellular service is not a Co-Op!

Subject: Re: EMMYS
Organization: Central Washington University

Upon Sat, 5 Nov 1994 19:51:00 GMT, the honorable Lori Martin
(lori.martin@andrews.infinet.com) graced comp.dcom.modems with:
[blah blah blah]
-] Well, having seen Patrick in Dune as Gurney Halleck, and in Excaliber and
-] that's it other than Star Trek and Saturday Night Live, he's darn good too.
[blah blah blah]

And this has WHAT to do with modems? Or should I abandon
comp.dcom.modems as yet another trashed newsgroup?

5380. Help! Uniden 147XLT scanner

Newsgroup: rec.radio.scanner
Date: 1994-11-13 05:36:15 UTC
From: rolewis@gopher.chem.wayne.edu
Message-ID: <3a48kf$f8q@gopher.chem.wayne.edu>
Source record: 265666

Hello. I was wondering about Uniden's 147XLT scanner. I'm getting this scanner for christmas. Me and my mom saw it at Kmart. It has a full display,
all six digits. This apparently must be the newer model because the other one only had two numbers and a red lit led. Anyways, on the box it says 25mhz to 512mhz, full featured scanner. This really caught my eye. Does this mean that the scanner is capable of scanning 25mhz-512mhz. I've seen some scanners that start at 30, 30-1##, 1##-3##, etc. What I won't to know is, does this mean no in between freqs, just full coverage from 25-512. Please help me, I'm really trying to understand this. Does anyone out there have this scanner, or know about it.

Thanks,
Ron

5381. Help! Trucking freqs.

1352 Cavalcade Dr.
Austintown, Ohio 44515-3844
Internet: ae411@yfn.ysu.edu

Its the "dog days" of summer, and summer is going, going...almost gone! Guess I wasn't high bidder-hi! To start things off this month we have another review of a newly released directory, so lets do...

RD Reviews: The Worldwide Aeronautical Communications Frequency Directory by Robert E. Evans (Universal Radio Research, 1994, 2nd Edition)

I purchased the first edition of this excellent aero reference back in 1991 upon its release. It has been my aero "bible" since, despite its rather small and unpretentious appearance. Now, just released is the new and rather spiffy looking Second Edition of "The Worldwide Aeronautical Communications Frequency Directory" (hereafter called the Directory...hi!), which is some 260 pages, and contains over 2,350 frequencies for both voice and digital modes in the HF, VHF, and UHF bands. The second edition of this directory is a much more conventional bound 8-1/2" x 11" in place of the original 5-1/4"

x 8-1/2", 42 page size!
Included in the directory are complete Major World and Regional and Domestic Air Route (MWARA & RDARA) information for 137 countries, company operations for 116 world airlines, Volmet broadcasts from 70 world cities and military coverage of 30 world air forces. The frequency lists are criss-crossed by frequency and location/type of use. A nice feature when your listening late at night and did he say "Puerto Montt" (SAM-SW, Chile) or "Porto Velho" (SAM-C/SE, Brazil)? A quick check of the criss-cross will tell you. Its also handy so as to tell that the "Moroni" you heard on 5658.0 is in the Comoros Islands!
Digital modes include both the HF RTTY nets as well as the new VHF ACARS protocol. Message content and the decipherment of aero communications is covered. These, along with 12 pages of MWARA sector maps, AFTN/ICAO/IATA codes, designator's and waypoint location/information, offer a lot more than a list of frequencies. There is an eight page glossary list and five appendices total, and a "source list".
Easy to understand text and all of the information packed into this directory make it ideal for both novice and experienced "aero" listeners alike. Highly recommended from RD, the Directory combines a lot of data I had to accumulate over years; and some I've never seen before. The Directory is item #0042 from Universal Radio (1-800-431-3939 or 614-866-4267) and retails for US$19.95. I'm sure other dealers will be carrying it also.

More Fax on Fax
You may remember awhile back Steve Wielgos (IN) reported NAM's Fax chart format change. Steve also noted that they were now being listed as "Cutler, Maine" instead of Norfolk, Va. Well, effective February 1, 1994 the U.S. Navy moved its Northeast Oceanographic Center's shortwave transmitters from Norfolk VA to Cutler Maine. This move reduced frequency coverage and the relocation reflects the Navy's increasing use of satellites for weather charts for the Atlantic fleet. Since northern latitudes do not have good satellite coverage, the transmission site was moved further north to better serve the Atlantic fleet. Civilian users of Norfolk FAX transmission will suffer from this reduced coverage. To offset this loss of coverage for civilian and commercial shipping, U.S. Coast Guard's Boston CommSta, NMF, has increased its transmission schedule, as has been reported.
This is all apparently part of a plan by the U.S. Navy to phase out all HF weather-fax broadcasts (Cutler, Maine; Rota, Spain; Pearl Harbor and Guam) starting with Cutler, Maine on Oct 1, 1995. The U.S. Coast Guard and the National Weather Service implemented Phase I of expansion of their Atlantic and Pacific WEFAX broadcast schedules on Jan 31, 1994. However, the long term plan is to broadcast WEFAX on INMARSAT C.

MILITARY

U.S. Navy
~ The U.S. Navy Hospital Ship USNS Comfort (T-AH-20) mentioned last month has been active on the standard maritime sitor frequencies sending UNCLAS SITREP's (Unclassified Situation Reports) to CAMSLANT Chesapeake, NMN, during the month. That takes care of "NCOM" but the ships Mars station, NNN0CCF, has not yet been heard.

~ Operation Support Democracy meanwhile continues at a rapid pace. According to the Navy News Service (NNS), in just a 24 hour period, over 3,200 Haitian migrants have been rescued by Navy and Coast Guard vessels. So many Haitians had been picked up from the sea that the Coast Guard cutters needed an assist from Navy "gray hulls" in the region to handle the volume. Nine-hundred Haitians were taken aboard USS Spruance (DD 963), and several hundred others aboard USS Flatley (FFG 21), and USS Clark (FFG 11) for the transit to Guantanamo Naval Station. Having the Navy ships who were on patrol to enforce UN sanctions transport the rescued Haitians allowed the cutters to return to their search for additional Haitian boats in the Windward Passage, according to the release.

This release illustrates another point in listening to these nets. The Foxtrot Mike net on 4090.0 Khz, and other frequencies, are the multi-national units of JTF-120 involved in Operation Support Democracy, the United Nations sanctions against Haiti.

The Foxtrot Charlie net on 6818.5 and 7741.0 are U.S. Coast Guard cutters which are a part of Operation Able Manner or watching for Haitians attempting to flee Haiti by the sea. There are still two distinctly different operations here. One is stopping people coming out, the other is keeping certain folks from coming in. I believe this has been confirmed a number of times by closely listening to these nets. On one FC net they made mention of doing "JTF-120 a favor" and checking out a ship, for example.

Then we have the Foxtrot Tango nets which are just U.S. Navy units which can be tasked on several missions or in training. These nets have been suspected in the past of being assigned to JTF-4, the U.S. multi-agency, anti-drug task force. They also recently were found on 5293.0 Khz giving the Foxtrot Charlie's a hand transporting Haitians to Guantanamo Bay.

The USS Inchon Amphibious Ready Group, which returned June 24 from a six-month deployment to the Adriatic and Somalia, has departed Norfolk Va. enroute to waters off Haiti this week. The ARG includes USS Inchon (LPH 12), USS Portland (LSD 37), USS Trenton (LPD 14), USS Spartanburg County (LST 1192), and the 2,000 Marines of the 24th MEU based in Camp Lejune, N.C. Other ships already on station to enforce the United Nations embargo include USS Cyclone (PC 1), USS Tempest (PC 2), USS Gallery (FFG 26), USS Kauffman (FFG 59), and the USS Wasp (LHD 1).

~ The U.S. Navy is deploying three vessels to the area around South Korea to bolster naval forces in the region if needed. The group is made up of the Austin-class Amphibious Transport Dock USS Juneau (LPD 10) and the Avenger-class Mine Countermeasures Ships USS Guardian (MCM 5) and USS Patriot (MCM 7).

~ The U.S. Navy Ticonderoga-class Aegis Guided Missile Cruiser USS Port Royal (CG 73) was commissioned in early July. Port Royal is the last ship of this class. She was authorized F.Y. 1988, and ordered February 25, 1988. She was laid down at Litton Corp.'s Ingalls Shipbuilding, Pascagoula, MS, on October 14, 1991, and launched November 20, 1992.

~ The U.S. Navy Nuclear Guided Missile Cruiser USS Long Beach (CGN-9) was deactivated on July 2 at NAVSTA Norfolk, VA.

U.S. Coast Guard

~ Reference to "CTU" which has heard and logged on the Coast Guard

frequencies for some time, this stands for Commander Task Unit. The Coast Guard uses exactly the same structure as the Navy uses since the Coast Guard falls under the Navy in times of war (and during certain exercises). The structure is: CTU reports to a CTG (Commander Task Group) which reports to a CTF (Commander Task Force) which now some times reports to a JTF (Joint Task Force). As in JTF-120...?

U.S. Air Force
~ The Air national Guard made history July 1 when they for the first time ever, began flying the B-1 bomber. The 184th Fighter Group at McConnell AFB, Kansas, received the B-1B Lancer and became the 184th Bomb Group. The unit, which had flown F-16s, also moved from Air Education and Training Command to Air Combat Command (ACC). A second unit, the 116th Fighter Wing at Dobbins ARB, Ga., is scheduled to convert to the B-1B, but a date has not yet been set.

~ The F-16's of the 512th Fighter Squadron will be inactivated at Ramstein AB, Germany and activated at Aviano as the 510th FS, according to the Air Force News Service. The 526th FS inactivated at Ramstein in March and became the 555th FS at Aviano. Both moves resulted from the 86th Wing's mission changing to airlift. A squadron of about 16 C-130s and associated units from Rhein-Main AB, Germany, are in the process of moving to Ramstein and should be in place by Oct. 1. The move brings about 1,100 people to the wing, which will become the 86th Airlift Wing.
The 76th Airlift and the 75th Aeromedical Airlift squadrons will continue their missions at Ramstein. The 76th supports distinguished visitors with C-20, C-21 and T-43 aircraft. The 75th supports aeromedical evacuations throughout Europe with C-9 Nightingales.

MARITIME

More Cruising
~ American-Hawaii Cruise Lines S.S. Independence, call sign KPHI, is entering dry dock to under go a refit July 20. The ship will be laid up until October some time.
~ OdessAmerica announced it has decided to use Gulfport, MS, as the springtime port for its 515 foot, 15,600 ton cruise ship Gruziya. They will offer eight cruises to Latin America and one party cruise in the Gulf from that location.

FCC Shuts Down KMI's Sitor-B
In late breaking news as this column was going to press, reports being circulated indicated AT&T coastal marine station KMI was forced by the Federal Communications Commission to close down their Sitor-B broadcast transmissions. An unnamed engineer for KMI was being quoted as stating they were not allowed to broadcast continuously on the SITOR channels allocated to them. Apparently this refers to their continuous traffic lists and station information which has run for quite awhile! At this time I was unable to learn any new information, but I can confirm that the broadcasts have ceased and I have not located any being made by sister stations WOO or WOM either.

AERO
Another mystery LDOC has appeared! Two months ago Tim Braun reported operating on 8095/11470 ID'ing as 'Sylvair', 'Big A', 'Connie Ops', and 'Khalitta Ops'. Now, Tom McKee checks in with news of a new LDOC operation he came across:

Cedar Rapids LDOC by Tom McKee
There is another new U.S. LDOC using the identifier "Cedar Rapids." I suppose this is an expansion of the Rockwell/Collins communications services. They have long used some of the equipment test frequencies for communications purposes, but what I am hearing now are on regular LDOC channels with service to all callers.
The frequencies I have identified so far are 8933, 10075 & 13348. I am also hearing Arinc New York on 8933, and this is a new channel for them. Johannesburg, RSA used to be about the only thing I would hear on this channel. The 10075 channel is shared with Universal Radio, "Houston". The 13348 channel is shared with Arinc San Francisco & Honolulu.
I expect that there are more channels for "Cedar Rapids." I would expect a 5 or 6 MHz channel, perhaps an 11 MHz channel, and almost surely 17 and 21 MHz channels. Hope this is as new to you as it is to me.

It sure is Tom, and thanks for the details. In fact, both of these operations reported by Tim Braun and Tom McKee are so new <how new are they!>, they didn't make the just released Worldwide Aeronautical Communications directory reviewed on page 1!

Another Bad Day...
Last month we had the Captain of the Labrador who forgot to mention a body stored in his freezer to certain customs folks. Well, this month, according to Steve "Mr. Warship" Schultz, the U.S. had previously agreed to sell to the Royal Australian Navy two former Newport-class Tank Landing Ships. On June 29, 180 RAN personnel were on hand in Norfolk, VA, for the formal transfer, but to the U.S.'s embarrassment, they were nowhere to be found. The 180 had been training in the U.S. since February, but when they went to assume control, the Navy found it didn't have final Congressional approval for the sale. The ships, the former USS Saginaw (LST 1188) and the USS Fairfax County (LST 1193); to become HMAS Kanimba and HMAS Manoora, respectively. See, it can happen to anyone...RD

==========
Note: This is the Nov. 'Electronic Edition' and is from the Aug. 1994 SPEEDX member bulletin "Shortwave Radio Today", ISSN 0882-8091. SPEEDX utility coverage now consists of three columns:

UTILITIES: Edited by Mike Wolfson. Logging's, frequencies, and schedule information. Contributions in these area's can be sent to Mike.

UTILITY NOTES: Edited by Rick "RD" Baker. News and information about the world of utilities, and utility stations. Contributions in these area's can be sent to myself.

UTILITY VERIFICATIONS: Edited by Tim Braun. "UTE" only QSL's and Verifications. QSL info. I hope to add Tim's column to the electronic edition soon.

SPEEDX members had this information over 2 months ago! If you would like to recieve this information as quickly as our members do, SPEEDX publishes a monthly DX bulletin of around 43 pages, Shortwave Radio Today (ISSN 0882-8091). Some of the other column's include:

THE DXperience: Focusing on notes,news,and views of what's happening in the exciting world of Shortwave radio. Edited by Dan Brame

TRASH & TREASURE: Information on catalogs, freebies, promotions, and SWL related items. Edited by Donald F. Weber

WHAT'S ON: A program listing, and some freqs for SW Radio edited by Daniel Sampson. (73540.3025@compuserve.com)

SHORTWAVE TO GO!: News and information on shortwave broadcast stations. Edited by Richard E. Hankison
WESTERN HEMISPHERE: SWBC logging's column edited by Don Thornton

EUROPE: SWBC logging's column edited by Tim J. Johnson

THE COMMONWEALTH: SWBC logging's column edited by Bruce Robinson

AFRICA: SWBC logging's column edited by Paul Wakefield

ASIA/OCEANIA: SWBC logging's column edited by William Westenhaver

QSL REPORT: a QSL reporting column edited by Michael Fanderys

SPEEDX AWARDS: A wide variety of awards are available for members DX'ing accomplishments, Harold Woering, Awards Chairman

....and more!

If you would like to learn more about the SPEEDX radio club, (the Society to Preserve the Engrossing Enjoyment of DX'ing), a Non-Profit ALL Volunteer hobby organization founded in 1971, please write to Bob Thunberg Business Manager, SPEEDX, P.O. Box 196, DuBois, Pennsylvania, U.S.A., 15801-0196. Club dues are as follows:

USA and Mexico $23.00
Canada (AO Airmail) 25.00
Central/South America, Caribbean (airmail) 29.00
Europe (AO Airmail) 33.00
Africa/CIS/Asia/Oceania (AO Airmail) 37.00
Outside North America (Surface Mail) 23.00

All prices are in US funds. Tell Bob you heard about us from the Electronic Edition!

5383. Help with mod

Newsgroup: rec.radio.scanner
Date: 1994-11-13 08:08:13 UTC
From: lem <lem@mixcom.mixcom.com>
Message-ID: <1994Nov13.080813.29400@mixcom.com>
Source record: 265682

I have a friend who is looking for someone to do the cellular restore on his Pro43. (The person who did mine doesn't want to do any more.) Is there anyone in the Milwaukee area who does this for a reasonable fee? He also travels up North and Minneapolis pretty regularly, so anyone around there would be ok too. Or, if all else fails, is there someone who does it mail order?

When I did my mod, I got the instructions from a ham radio ftp site. I don't remember where it is though, does anyone have the address handy?

(My freind, a fellow wedding photographer, is going to give me a list of all the frequencies he has programmed and I am going to try to give him the names of a couple people who do the mod and the mod instructions, which I deleted when I was done with them.)

This last thing is only vaguely related, but I don't know who else to ask:

When I did the cell mod on my Pro43, I did the kill key beep too. I hate key beeps. What I am wondering is, where did these mods originate, or how? I am wondering because I have a SONY cordless phone which makes the most annoyingly, piercing key beep and I would dearly love to kill it. I did take it apart when I first got it, but it is just a circuit board-meaning less to me. Is there someway to figure out how to kill the beep by looking at it? Where could I go for a schematic, or would it be part of a huge, expensive repair manual?

Thanks!

In article <36simqger1@mhadg.production.compuserve.com>, Nigel Le Poidevin <100046.2520@CompuServe.COM> writes:

I've got a Pro-2021 and have had it for about 5 years. I have seen time and time again postings for mods with responses stating "not much you can do with it." I do have one, which I will add here, that states it will speed up the freq. scanning rate. Have not tried it myself as I've been looking for a separate source first to confirm it (don't want to blow up a perfectly good scanner!) Good luck finding more.

>>
First, you will need one 15K-ohm,1/4 or 1/2 watt resistor, radio solder and a small soldering iron, and simple hand tools. Make sure the radio is unplugged from its power source, and that the 9-volt memory battery is removed! As you will be working in the area directly connected to the microprocessor, failure to heed this advice may prove fatal to your scanner!! Now, remove the upper case-half only by removing the four screws (two per side) on both sides of the outer case, as well as the one screw on the rear apron of the radio which fastens the upper case to this surface. Carefully lift up the top case section and unplug the white plastic two-conductor speaker plug, allowing removal of the upper case entirely to simplify working inside the radio. With the scanner sitting upright and facing you, locate resistor R-147 (a 39K-ohm resistor to the left-front of the main board almost behind the vicinity of the LCD display). Care-fully snip the leads at the resistor body with a pair of sharp wire cutters to leave as much of the existing leads as possible. Solder the 15K-ohm resistor to those remaining leads. If you wish to totally replace R-147, it will be necessary to remove the lower case half and unsolder an RF shield on the underside of the board; soldering the new resistor to the old leads simplifies the process. Reassemble the scanner in reverse order of disassembly, reinstall the memory battery reconnect the scanner to the wall outlet; re program the memory, and you will now have a radio that scans and searches three more channels per second an improvement you can see as the numbers fly by.

I am currently using an Amiga A500 computer linked to an Icom R7000 with a package called Scan7000. This package works extremely well but I am wanting something which will run on a PC. What I require is a program which will say the frequency and time of a hit and record it to either the left/right track of an audio tape with the comms from the radio coming in on the other track. At the moment the Amiga does this job very well but looking at some adverts for PC scanning programs I have not seen this function listed. Can anyone advise me of a scanning program for the PC which will do this task. Please post any answers to this newsgroup or directly by email.

Thanks in advance,

Are there any other sites with the GOES images? That site doesn't allow guest login for some reason (at least when I tried).

SH>I don't think so, I tried to hit MONITOR while in Search Mode and it
SH>stopped on the freq. I then hit L/OUT but nothing happened. The only
SH>thing you could do I guess is search just above and then later just below
SH>it. Annoying but may be the only way... :-(

SH>Anybody?

Check Bill Cheek's article in the Feb. 93 issue of Monitoring Times. It is a mod you can easily do that hits the up button after a predetemined time. I set mine for 30 seconds. I'm going to add a switch so I can choose between using it in the search mode and using it in the scan mode.

(704)837-9200 is MT's phone number.

Don't forget WWV and WWVH (Hawaii) also broadcast on 2.5 MHz. They
transmit in AM not SSB. The male voice you here is the Colorado
transmitter while the femail voice originates from the Hawaii
transmitter.

Neither of you mentioned the bins of parts they would push out onto the
sidewalks in front of the stores every morning. (They did take them in didn't
they?) It was like rooting in someone's attic. I haven't been there in thirty
years. I am truly sorry to hear that they have gone. I have found over the
years only two stores that even came close. One in Orlando, and one in the
San Fernando Valley (Burbank(?))up off Lankersham if I remember correctly.
We have nothing in Atlanta that even comes close :-(

Hello,

I recently picked up a used ICOM R1. I know about the shortcomings of this radio, but it's still fun. A few years ago, an outfit in the UK offered a mod to improve the intermod situation. I later heard that that company became an ICOM dealer and stopped offering the mod. Anyone have any specifics on what the mod involved and how well it performed? Thanks...

From: traynort@ucs.orst.edu
Message-ID: <3a5i9u$sp3@gaia.ucs.orst.edu>
Source record: 265705

I have been looking at purchasing a handheld scanner that has tripple conversion and includes the Military air band (225-400mhz). I have come to the conclusion (Correct me if your views differ) that a Radio Shack Pro-43 or a Uniden 2500xlt are the best radio's for these requirments. The problem is I have hear that uniden has discontinued it's 2500xlt and Yesterday My Radio Shack dealer said that THE PRO -43 HAS BEEN DISCONTINUED too. Rat Shack said the Pro-62 is replacing it but the Pro-62 does not receive the Military band. Is this true? Has there been a bill passed to outlaw access to the military air channels? Just a little concerned.

Well you got my attention. There are ten cordless phone frequencys
46.610, 46.630, 46.670, 46.710, 46.730, 46.770, 46.830, 46.870, 46.930,
and 46.970. there are also 5 baby monitor frequencys 49.830, 49.845,
49.860, 49.875, and 49.890. Sometimes you get half a cordless
conversation on a baby monitor freq. This is because some phones use one
of these freq for the handsett.
Cell phones is another matter the best thing to do is just scan from
about 870 to 912 if you can and see what you find. If your scanner
doesent get thes freq's try scanning from as close to 900 as you can get
up to about 925 or so and you may be able to find some.

National Weather Service forecasts are usually found on at least one of
these frequencies, depending where you live, and what weather office
is broadcasting where & what frequency:

162.55
162.4
162.475
162.425
162.45
162.5
162.525

You may find other weather frequencies. I hear several others from where
I live, which are local airports issuing weather forcasts/conditions
for pilots.

>to pump through my scanner.

It could well be. I'm not up to speed on US TComms, but if the system is anything like UK, The so-called 80VAC would actually be a bias of 50VDC (some prefer +25V and -25V :-), but the pd remains the same) with an AC superimposition for the ring. If I'm anywhere close, an in-line capacitor (select your value carefully) would be a good start. I still wouldnt want to feed the signal in directly!

I'm relatively new as a SW listener, so this has probably been asked ad-nauseum, but what are those strings of numbers broadcasted on SW. Tonight (Sunday) I here a man saying groups of numbers, constantly, at 5.770 mhz. Reading material I have says "spy" transmissions for the last 30 years. If you ask me, this is quite a low-tech way of transmitting super-secret stuff these days. So who's spying, and what's the code? ...Just hope no one gives me the line, "I can tell you, but if I do I'll have to shoot you"...

You are welcome to call me. My home number is 218-9375.

you say you were interested in Round Rock and I see that you already have some frequencies to work with. EMS is done by Williamson county on 462.975 they share the frequency with Austin EMS which makes for lots of Interfearance depending on where you live. Listen for Round Rock EMS units 804 and 806. Even number units are BLS and Odd numbered ones are ALS.. (or is it the other way around .. hum) .. anyway. .just listen and you'll figure it out. All the rest for Williamson county has already been given to you in previous responses. Listen out especially on their back channel 5.. for lots of good stuff. The Garden Ridge pottery by my house on 1325 and I35 uses 154.570 but that is common and several businesses. I am looking for frequencies for DELL security. They use rent-a-cops. Call for more info

They also have a 100hz subcarrier that specially designed digital clocks
can receive and decode (like Heathkits "Most Accurate Clock"). I do
know that the WWV people had an applications note on a decoder design.
Does anybody have c copy of that apps note? With Heathkit gone, getting
that apps note and buiulding your own decoder may be the only way to get
a self-setting clock...

Overall, its not bad. It is typical Uniden: great features and looks, but
poor RF with intermod problems. If you live in a high RF environment it might
not be the best choice. Unless you are really in love with the alpha readout,
get the 2006.

If you are willing to go to $299, you may want to check the BC 220XLT. I think the price is around $260. I would prefer it over the 51 or Sportcat. It will search at 300cps and has lockout during search. Check it out.

A discone antenna on the roof will probably do the trick for you. Radio Shack
sells one that isn't too bad for about $60. If you want a slightly better
one, get the Diamond discone sold by Grove and others.

> What *is* section 633 of the Communications Act of 1934?

> --
[snip]

> (II) by any governmental law enforcement, civil
> defense, private land mobile, or public safety
> communications system, including police and fire,
> readily accessible to the general public;

In a previous section of the ECPA:

(16) "readily accessible to the general public" means, with respect to
a radio communication, that such communication is not--

(A) scrambled or encrypted;

(B) transmitted using modulation techniques whose essential parameters
have been withheld from the public with the intention of preserving the
privacy of such communication;

(C) carried on a subcarrier or other signal subsidiary to a radio
transmission;

(D) transmitted over a communication system provided by a common
carrier, unless the communication is a tone only paging system
communication; or

(E) transmitted on frequencies allocated under part 25, subpart D, E,
or F of part 74, or part 94 of the Rules of the Federal Communications
Commission, unless, in the case of a communication transmitted on a
frequency allocated under part 74 that is not exclusively allocated to
broadcast auxiliary services, the communication is a two-way voice
communication by radio;

So, to me, it looks like there is no right to listen to ALL public service
comms.

5427. story: Patron saint of mailboxes

Newsgroup: rec.radio.scanner
Date: 1994-11-14 13:40:06 UTC
From: dwhite@dsys.ncsl.nist.gov
Message-ID: <3a7pbm$ak8@dove.nist.gov>
Source record: 265536

All weekend, my wife has been calling me the "Patron saint of mailboxes". Here's why...

Friday night, some kids were driving around in our "neighborhood", whacking mailboxes. (The "neighborhood" is about 12 farmhouses in a 5 mile radius) They got my in-law's box, next door, but missed ours, probably because our hose is on the road, 30 feet from the mailbox.

So, Saturday night, I'm just crashing in bed about 10:30 when I hear two metallic "whang!"s - that particular hollow mailbox-crushing sound - followed by gravel being spewed and a car accellerating quickly. I figure we're hit, so I putt on outside with a flashlight to check.

Turns out that it wasn't us, but the neighbor to the east. I looked around some more anyway, and found a fence gate open, went over a closed it. As I'm walking back around the barn, I hear 4 "whang!"s, gravel thrown and a car to the west... but the car is heading TOWARD me.

With a big grin, I step behind a big oak tree near the road. The car rounds a corner, gets up to the tree, and I lean out with the flashlight on. Just like deer, the kids look at the light as they go by, and I get the tag numbers along with a look at the faces.

Now the fun starts. I go inside dial up 911, give 'em the poop, and fire up the scanner. The call goes out to the state and local town police, to keep an eye out for the plate & description of the car; they send a town cop to the owner's home, just in case.

Now, since we live 5 miles from the state line, I figured - no way. They're headed north ASAP for a while... but I must've scared something out of 'em, because they caught a state cop's attention going a bit too fast. Turns out that the driver had no license, an underage girl in the car was drunk, and none of 'em had brains enough to fill a thimble.

So the cops had 'em dead to rights in under 10 minutes, 10 miles from our place, and called in all the info. A cousin, who also has a scanner, dug out her high school yearbook, found the name, remembered the guy, and called us up asking "Any excitement up your way?" She said that she wasn't surprized that the guy was smashing boxes, and wasn't surprized he got caught, either. :-)

As we listened, one of the kids decided to rat on the others for a break, and the state cop said they'd be cruising the roads to find the boxes they hit. Sure enough, 5 minutes later, the cruiser passed by, and they circled around a few times as the kid spilled the beans.

I figure, kids will be kids, but these kids were stupid enough to come back two nights in a row (or unlucky enough to follow someone the night before), to double back past a box they hit, and driving around too drunk to care. They deserved what they got. :-)

I am looking for an accurate list of Dutchess County, NY frequencies. Stuff like police, fire, business, hostipals, highway, etc. I have already a rather long list but there are alot of errors in it. Like one freq being listed as both an ambulance and school bus. Plus I have found some new freqs myself and need to identify them.

Dutchess County consist of 'major' cities of Poughkeepsie, Fishkill, Wappingers Falls and the like.

I already have Police Call and Beyond Police Call. I guess I am looking for something BEYOND Beyond Police Call. 8-)

I'm new to this scanner world, and I have some basic questions about how it all works. I just picked up a Radio Shack 50-channel programmable, and any help you all could give me in understanding how to use it and how it works would be greatly appreciated.

Here goes...

1) How do scanners pick up cordless telephones and cell telephones? What's the technology? If I'm talking to a person who has a cordless telephone, but I have a regular phone, can my conversation be scanned? What kind of distance are we talking about?

2) Someone wrote that there's a Clinton bill that makes it illegal to use scanners to listen to phone conversations - true? What bill? Was this addressed in the crime bill?

And what U.S. Appeals Court said that there is no expectation of privacy on cordless phones? What's the scanner ban of '92?

Who makes scanners 800 freq and up? Anyone other than Radio Shack?

And finally, if you don't have the patience to answer these questions in detail, is there an up-to-date FAQ somewhere that might help?

Thanks in advance.

Jo

I use the GRE Super Amplifier on my Pro-43, no images, overload, or intermod. The better the scanner's front end, the less problems with the preamp.

Good job! Kids in Florida weren't so lucky several years ago in Florida.
A old timer who's mailbox was hit several weekends in a row Rigged up his
mailbox with gunpowder (I forgot exactly what was used, it ws explosive).
Anyway, the kids came by and whakced the box but got a surprise this time.
The 'whacker' wound up in the hospital with serious facial burns. Guess
he didn't see it coming :-)

The home owner was arrested, not sure of any convictions though.

Forget U.S. troops, it is the BATF that we should worry about. They
kill innocent people every day, just because they legally own guns and
the BATF arbitrarily decided they should not.

>
No one really knows what these numbers stations are, there has been so
much speculation about them for 30+ years now. As for low tech, well SW
radios are cheap and plentiful, would probably not raise any eyebrows
if you were to own one. BTW the USAF still broadcasts SKYKING messages
which are coded messages ("Skyking, Skyking...do not answer... Hotel,
Mike, Bravo etc...") The guys up in the B-52's will verify todays code
and will either fly to target, or not. I copied the numbers b'cast as
well and had a pretty fair signal here in Ottawa, Canada (lat/long
W75. 44' N45.24').

Thanks for taking the time to answer.

Up to 1st April, this year, I had gathered an almost complete list, through HARD listening.

As is the way, though, the USAF decided to change the complete tie-up of frequencies and Foxtrot Numbers. Unusually, this also included the addition of some new frequencies and presumably the deletion of some others!

I have now collected approx. 75 new tie-ups and I am hoping beat the system with the acquisition of someone else's hard work. This will allow me to get on with my main interest of DX'ing SAM comms. world-wide.

Scott is one of the Mystic Star relays that has been given up, however, many others remain VERY active.

LONG MAY THEY

Seems a couple of hams could get a fix on the location using telemetry.

Find out the exact degree their antenna points for the strongest signal,
Using two points of reference, you could draw two lines till they
crossed, and bingo you know where they are.

Anyone tried?

: Heck, I'll go $550! Best offer so far...do I get it??

$600, not a penny more. In fact, if anybody has a *blocked* IC-7100, I'll trade them for an *unblocked* (well, never blocked) IC-7000. Unlike most people it seems, I'm not interested in listening in on Cell calls, and the 7100 has a better receiver for use in Amateur Satellite downlinks.

[Article crossposted from alt.radio.scanner]
[Author was SMITH]
[Posted on Mon, 14 Nov 1994 22:18:55 GMT]

I'm looking around to buy my first scanner, and I have a few questions that I would be grateful if someone could explain a few things about:

1. How many channels are practical? I realize that a 1000 channel unit would be nice, but I don't think it's worth the extra cost of say a 200 channel unit. Is there any limitations to only 200 channels?

2. What does the "800-MHz trunked radio systems" feature entail?

3. How about "Triple-conversion circuit"?

4. Is there anything else I should look for?

Thanks in advance for any help, information on scanners seems to be hard to come by.

>is offered in other areas of the U.S., specifically the Upper Pennisula

Actually what you heard was not the national weather service. It was
a group of ham operators who did stormnet as part of their hobby. These
services may be available in your area, all you have to do is to get in
touch with the local amateur radio club and ask if they do such
activities. Otherwise check 162.475, 162.400, 162.500, these are the
national weather service. Personally I like the stormnet better.
Another option is to contact your local ESDA chapter- they often do
storm watches and reports and nearly all cities with a municipal fire
dept. have the service.

Hope this Helps

5462. New system in SC

Newsgroup: rec.radio.scanner
Date: 1994-11-15 01:35:09 UTC
From: allen@tricetv.ColumbiaSC.NCR.COM
Message-ID: <CzACEL.86A@ncrcae.ColumbiaSC.NCR.COM>
Source record: 265602

There is a new 800mhz trunked system in the Columbia, S.C. area. I spent some time this weekend searching some 800 bands and found some in use between 856-861mhz. I've listed below the freqs I got hits on. The control channel was switched once a day at midnight Saturday and Sunday. If anyone knows of any other freqs in use plese E-mail to me. I haven't seen these published anywhere except for the four freqs noted below. The system appears to be shared by State Highway Patrol, Lexington County Sheriff and EMS, and a maintenance crew of some kind, possibly an electrical crew.

Freqs published in The Frequency Almanac by U.S. Scanner News

851.8125 nothing heard
851.4875 nothing heard
856.7125 data transmissions?
857.7125 data Transmissions?

Freqs found in search mode--groups listed above heard on all these:

857.0375
857.1375
857.1625
857.3375
857.3625
858.0375
858.1625
858.3375
858.3625
859.0375
859.1375
859.1625
859.3375
860.0375
860.1375
860.1625

Hope this helps,

Allen

>would be nice, but I don't think it's worth the extra cost of say a 200
>channel unit. Is there any limitations to only 200 channels?

Yes and no. Depends on other things ... how many "banks" of how
many channels each does the 1000 channel unit have? If you organize your
scanner by sercies or geographical areas (as many of us do) 10 banks of
20 channels each is often not quite enough banks. I'd NEVER have qa
scnner with less than 20 banks per channel or the option of setting the
number in a bank (I THINK some units used to let you do this) as it is
pretty easy to find 20 or close to that number for each bank. If the
difference is price is too extreme or at all affordable and everything
else is equal go for the extra channels - especially if configured in a
larger number of banks. I consider 200 a minimum for your everyday
primary use scanner.

>2. What does the "800-MHz trunked radio systems" feature entail?

The 800 mHz range of freqs includes some services aht 'share" a
group of frequencies on a complex computer controlled basis. You need a
scanner that will receive this range, but there are none that will
automatically "follow" the indidiual conversation from frequency to
frequency other than by scanning all those involved. Sound confusing? It
is! Suffice it to say you want a scnner that receives (and does so well)
this range of frequencies. Because these 'trunked" systems use a large
number of channels this is another argument for a large number of
channels and banks in the unit you purchase.

>3. How about "Triple-conversion circuit"?

Complex technical stuff. You need it if available and all the
other features are what you want. Very good to ahve in an urban
RF-saturated envirornment.

>4. Is there anything else I should look for?

Aircraft coverage with AM mode (pretty common) and Military Air
band (200 - 400 mHz in AM mode>. I'd not consider a scanner without it.
Sooner or later you'll want to listen and it isn't that tough to find.

A real good entry level scanner that meets all MY minimums is the
Radio Shack PRO-43 (soon to be replaced by another unit like the PRO-60
or something.) Be careful of what the Shack salesdroids tell you. They
will often know less thant what you now know after reading this post.
OTHERS: please chime in and help this guy!

11/14/94
I'am looking for a scanner that covers 217 Mhz. This is the animal tracking range. The new "full" coverage scanners take this range in, however they are quite expensive. Does any one know of a low end scanner that covers this range or perhaps an older model. If someone does and knows the make and model number I can then keep my eye out for one in the trade papers, etc. Any help would be appreciated, thanks.

I am VERY interested in cellular and am having a difficult time getting straight answers. Any assistance would be greatly appreciated and rewarded.

Basically I need to know what do I need to get in.

What scanner is the best and who sells it?
What is the deal with this Curtis ESN product?
Where does one get the mod's?
What about changing ESN's
Where do you find software?
What is DDI
Can any one source put together all the pieces and just SELL it to me?

Signed Lazy with Cash

Thanx

Those are voice frequencies -- a modem is a device that connects
to your computer which allows for decoding of digital data... The Chicago
service is run by amateur radio operatorsand I doubt anyone in the UP
offers such a service.

I had a realistic discone once, and was happy with it. I put a 69"
vertical element in the middle of it, and it did help out with the vhf-low
stuff. I don't think it had much effect on transmitting on 2 meters either.
It may have been luck, or maybe wherever I got the mod idea from had
transmitting in mind when they recommended the length. I don't think there is
much too critical about discones in general though.
One other observation; a couple years after I had put it up, it went
through an ice storm, and a couple of the lower elements didn't make it. I
checked it out later and although the elements themselves are stainless, the
small threaded piece that is crimped into them is / was made of what looked
like pot metal. It was very brittle, and when I tried to straighten out the
remaining elements, some of them broke. I don't know if the Grove/Diamond

discone is the same way, but it may be worth a try.
Just my 2 cents.....

>I have been disconecting the cable when not in use,
> and this is getting old....

Disconnecting *and grounding* the antenna when not in use is still
the best protection. I perform the ritual for my tallest antennas
and constructed an antenna patch panel to ease connection/disconnection.

It consists of a large steel electrical box with a hinged door.
There's two rows of feedthrough coax connectors -- the type which
are threaded their entire length -- mounted through holes on the front
panel. One row is for antennas and the other for radios. Inside
the panel are lightning protectors.

When not in use, I attach a shorted PL-259 to the antenna
feedthroughs using a spring-type push-on connector.
I have a set of short coax jumper cables I use to patch any radio
to any antenna.

Sure, there are small losses due to the connectors, but they
are insignificant in my application. Also, it would be better
from a lightning standpoint to keep the patch panel outdoors,
but I keep it inside for convenient access instead.

Lose the discone and erect and antenna which is at "DC ground."
Most discones float above DC ground and are more prone to let
a charge build up or become a lightning attraction. Some radios
have a high value resistor between the center pin of the
antenna terminal and ground to bleed off static charge.

In general, I don't recommend a discone for the main outdoor
antenna -- especially in lightning prone areas. My FAA-surplus
discone sits far below my other antennas, which are at DC ground.

I do not think that the data is encrypted, per se, but the data format is
proprietary so the effect is the same. For example, how do you know if they
send the letter 'A' as 1110010111011100 or 1001101010001 or 10110110?? My
point is they can send the data however they want (and this assumes that they
are using two frequencies to send the data, -high & low rather than some RZ
or NRZ scheme).

You need some inside info!

Well, tell him that the Pro-43 is in the 1995 Catalog, and that RS does indeed have them in stock. I suggest you call other RS dealers. If not, I can give you the address/phone # of a bunch here in the Dallas-Fort Worth area that have plenty of Pro-43 stock (I just bought one).

The Pro-62 doesn't have the mil air band, and I SUSPECT it's alot harder to modify (if not impossible) for cellular coverage.

147.06 is an amateur frequency, and I suspect that this was done on packet
radio as a service to other amateurs. The fact that you could receive it
was, well, just an ancillary benifit! This particular service would vary
upon area, but the frequency is certainly not standard. Sounds like a
service performed by a local ham or ham club.

If you plan to use the CIV interface and connecting either the 7000 or 7100 radio to a computer,
choose the 7100. It has a considerable more features that can be selected using the computer
interface. The 7000 model only allows basic programmability like frequency and mode setting. The
7100 will allow information like signal strength and squelch status. In general, the computer
interface can control almost every function on the 7100 while the interface can only control a
couple of the functions of the 7000. I have been writing software to control my 7100. Using
the computer as a scanning controller, the scan speed of the 7100 can be increased
to about 15 channels/sec.

Since the performance of the two receivers is approximately equivalent. The only disadvantage
I have seen with the 7100 is the center frequency meter. But it is a small price to pay for
all the addition control.

Eric Evans

Bob,

I thought that in the Pro-43, only channel 1 could be listed as the priority channel????

Thanks

Brian

Don't think so, at least not in the Northern Va area. I believe that it is
2400bps POCSAG, but can't tell for sure. Also note that the EPCA describes
some communications that may be illegal to monitor that are:

transmitted using modulation techniques whose essential parameters
have been withheld from the public with the intention of preserving the
privacy of such communication;

Ken

In modern Radio Shack scanners, users can designate any of the memory
channels as a priority channel. For example, the sequence for
designating channel 42 as the priority channel is PROGRAM, 42,
PRIORITY, if I recall.

Make sure you have designated the priority channel you think you
have and that a sane frequency is programmed in it.

I've saved a couple of postings on numbers stations. Here they are. They include information about the locations.

NUMBERS HF stations

This topic has been discussed in the past, but I found this nice summary the other day. It might be interesting to the newer reader of this forum:

"Spy Numbers Transmissions" are a shortwave oddity which have been around for the last 25 years. They are commonly heard in English, German, Spanish and the Slavic languages and take the form of four and five digit groups of numbers which are preceded by a three digit "identifier" and a "group count" which corresponds to the number of number groups transmitted in the crypt. They are generally broadcast by a mechanical- sounding YL, although Morse code (CW) "cut number" transmissions are also frequently reported, as are phonetic alphabet trans- missions. Several distinctly different formats have been noted.

The "who" and "why" aspects of these transmissions are, for the most part, unknown. Their mysterious nature has resulted in their common characterization as 'spy' trans- missions. Information on the "where" aspects below.

The spy theory has been enhanced over the years by the FCC's inconsistent position in response to numerous inquiries by the Shortwave Listening community.

If you've never heard a numbers transmission, tune your radio to 11468 kHz any Saturday at 4pm EST (2100 UTC). You'll almost certainly hear a 'classic' numbers transmission which will run from 15-30 minutes. The signal from this Saturday transmission is very powerful and can be heard across the United States.

In regards the "where" - a number of sites have been identified in recent years, notably in Warrenton and Remington, VA and Miami, FL. In addition, with the aid of sophisticated RDF (radio direction finding) equipment and the invaluable assist- ance of highly authoritative and professional resources, several new transmission sites have been positively identified over the past several months, including sites in Nicaragua, Honduras, El Salvador, Cuba and Cozumel.

One particularly dangerous station has been interfering with air to ground traffic on 6577 kHz, a frequency allocated to inter- national aeronautical communications in the busy Caribbean sector. On at least one monitored transmission, the air traffic controller at ARINC moved the pilot to an alternate frequency as the numbers transmission was totally blocking the

frequency from effective use. This regular transmission can be heard on Mondays at 0200 UTC (Sunday night local US time) across most of the US.

A recently identified Cuban site (Guineo) is believed to ba a major transmitter site used by DGI (Cuban Intelligence).

There has been some suggestion that the numbers are a form of 'one-time-pad' - a crude but unbreakable form of encryption (unless you've got the key, that is) - if that's the case, it's very curious to note that the same five-digit groups are often seen to repeat over and over again in the very same crypt - and that the same transmissions are seen to repeat from week to week, and from month to month - so often, in fact, that tape breaks are sometimes noted. When spliced back together, the sloppy handling sometimes results in truncated 5-digit groups - the end result being amixture of 4 and 5 digit groups in the very same transmission!

These facts would tend to point one away from the one-time-pad concept and support a couple of other theories - suggesting that the numbers are NOT a cipher, but rather a code unto themselves, and that much of this traffic is 'dummy' in nature - broadcast simply to keep a frequency open over a long period of time.

In addition, most five-digit Spanish numbers transmissions are very badly over-modulated, resulting in numerous spurs up and down frequency. When broadcast under such conditions, the numbers (6) seis and (7) siete are almost indistinguishable, making it impossible to copy a crypt without numerous errors.

It is worth noting that the four-digit Spanish and English transmissions do not reflect this same technical ineptitude.

There are a number of reference materials available which provide detailed information about cryptography and cryptanalysis, in general, and numbers crypts, specifically. I'd be happy to provide anyone interested with a list of books.

Only two publications I know of are currently available which provide regular coverage of numbers, clandestine, pirate and other interesting transmissions. The ACE Bulletin (monthly news- letter of the Association of Clandestine Enthusiasts - PO Box 11201, Department KK, Shawnee Mission, KS 66207 $16/yr) and the Umbra et Lux Newsletter (a newsletter devoted to SIGINT, covert radio and related topics - 10606-8 Camino Ruiz, Department KK, Suite 174, San Diego, CA 92126 $18/yr).

I'm told that other languages can be heard as well. An interesting fact(?) I've come across in my reading is that some of the 5D/SS/YL transmissions

originate in the USA at some kind of federal facility in Virginia.

I have personally been a party to tracking down the source of the spanish numbers lady affectionately known as "Cynthia" to the "US Army Warrenton Training Facility" near Fredricksburg, Virginia.

It has long been conjectured that rather than the US Army, the facility is run by NSA. If you consult Marchetti and Marks' book "The CIA and the Cult of Intelligence" there is a thinly veiled description of a training facility that is used for NSA broadcasts. I suspect rather strongly that the Warrenton facility is what was referred to in the book.

Most folks that are close to the subject say that the numbers broadcasts are intended to be used to communicate with agents in the field via the use of a simple portable shortwave receiver and a "one-time-pad". In much of the developing world, shortwave is used to provide domestic broadcasting. Hence the low profile needed by a field agent is maintained despite the fact that they have a simple S/W receiver. If they were packing around an INMARSAT crypto phone, it would be far more incriminating if they were to be searched. Of course the one-time-pads are somewhat problematic, but are pretty easy to conceal.

At any rate, I am only repeating logical sounding conjecture I have heard from some of the so called experts on the subject.

But the Warrenton Training Facility is the home of Cynthia, the spanish numbers lady for sure.

"One Two Three Four Five Six Seven Eight Nine Zero

Zero Zero Nine, Zero Zero Nine, Zero Zero Nine, Zero Zero Nine

Groups 198, Groups 198"

Have you ever tuned into a station on shortwave radio reading a message such as the one above ?

You'll find that there are lots like it at any time of the day. Men and women reading messages in English, German, Spanish, Russian and many other laguages. Some messages feature groups of numbers, some groups of letters.

These are the so-called "Numbers Stations".

Where and when do I find them ?
What are they for ?

These are a couple of questions that we hope to answer.....

ENIGMA

is the

European Numbers Information Group and Monitoring Association.

A new group has been formed in the UK devoted to exploring the Numbers Stations mystery. A regular newsletter is being produced giving detailed information on times, frequencies and characteristics of the Numbers Stations.

ENIGMA is also a discussion forum and with the help of regular monitors it will be possible to uncover a vital clue to the whereabouts, purpose or meaning of a given transmission. You can help by participating!

ENIGMA is based in Europe but we welcome help and information from listeners world-wide.

Issues 1 and 2 of the Newsletter are already available:

ENIGMA 1
========

This was the introductory issue with 7 pages of times, frequencies and schedules of the known regular European Numbers Stations. There is detailed information about:

The Lincolnshire Poacher
Swedish Rhapsody
The Counting Stations
The Russian Man
Strich/Oblique
The Phonetic Alphabet Stations

ENIGMA 2
========

Features in-depth analysis of the "Lincolnshire Poacher" together with more details of Numbers Stations Schedules. 12 pages in total.

ENIGMA 3
========

Is due for publication in early October 1993 and will feature a detailed look at the "Phonetic Alphabet" stations. The deadline for the submission of your letters and logs is 16th August 1993.

The ENIGMA Newsletter is available for just the cost of postage or the equivalent in International Reply Coupons (IRCs). Please send stamps/IRCs/donations and your address to:

Chris Midgley
195 Roberttown Lane
Roberttown
Liversedge
West Yorkshire
WF15 7LE

United Kingdom

Chris respectfully asks you not to send envelopes!

Meanwhile, I will be happy to co-ordinate the electronic side of things here on USENET. Any reference material, archive articles and logs sent to me will be passed on to Chris for inclusion into the newsletters.

Well, I just got a bit of a flame in mail from helix@solaria.sol.net. I'm not sure for Rob's reasons for not posting it in the thread, but maybe it's due to the fact he obviously didn't understand what has been said about Radio Shack and the fines levied against employees who talk about mods to their products.

I confirmed lastnight with the manager of the store where I work part-time that Tandy Corp. puts a $5000 fine up on an employee who gets caught talking about how one could modify one of the RS house brand scanners (etc...) for picking up cellphones.

I can't help but wonder why Tandy is so worried about that.

: but I will take all.

As someone else already answered, the helmet radios are encrypted, sliced, and diced so much that it's probably virtually impossible to listen in.

Last season, some clown asked about the "radios" between the coaches way up in the glassed-in boxes and the sideline coaches. All you have to do is watch a game, on TV or in person, and carefully observe the poor fools who walk around behind the head coach (and others?) unreeling and reeling in the wire attached to the headsets that the coaches wear. They're using copper, not RF, as the communications medium to avoid being overheard.

About the only thing you might be able to get on a scanner would probably be stadium security (which, in this age, is likely to be DVP'd now...), the maintenance crews, broadcast crews and other service personnel, very little of which will enhance the enjoyment of the game, IMHO.

> the preamp.

That is not exactly true. If the pre-amp stays in its linear range, than intermod distortion will be based on the scanner's front end performance. However, it the pre-amp has a poor (low) third order intercept point than the pre-amp itself will generate intermods which the scanner will treat a a "good" signal. Therefor, what someone wants is a pre-amp with 1) a low noise figure, 2) a high third order intercept point, and 3) good gain (about 12 to 15 dB).

What *is* section 633 of the Communications Act of 1934?

To which, I reply -

You were very efficient at finding Section 2511 of Title 18 of the
United States Code. Well, guess what - The Communications Act of 1934 is
the popular name for Title 47 of the United States Code. (No, I'm not
trying to be sarcastic - it's just that it's really that simple and
straightforward!). BTW, the FCC Rules and Regulations, which _implement_
what is promulgated in 47 USC, is found in Title 47 of the Code of
Federal Regulations (47CFR...). So, when you look at a computer and see
all of the hooplah around Part 15 Subpart J, etc., it's 47 CFR 15 (J).

Me, I'm licensed under 47 CFR Part 97, which covers Amateur Radio.

BTW, IF you could transcribe 47 USC 633 (or interesting excerpts of it),
I, for one, would appreciate it, as I don't happen to have a copy handy.
(Although I can get copies of the Comm Act of '34 and the chunk of FCC
Rules that cover Amateurs, CB, GMRS, etc. from the Government Printing
Office, it's a hell of a lot easier for me to buy the ARRL book instead!)

Thanks, and 73.

In a previous article, levy@fndcd.fnal.gov () says:

>I'm looking for info on the encoding format used by the Mobile Data Terminals
>many police organizations are using now. It sounds very much like other types
>of radio data transmission, but the $64,000 question is, it it encrypted?
>
The Ottawa Police Force has been using MDI/MDT systems for over 10 years now.
The technology was developed by MDI in Vancouver, B.C. This company was the
subject of a hostile take over a few years ago. The best info I have is that
the data is not encrypted...but it may as well be! The operating system and
all the operating software is proprietary. So unless you have a MDT plus a
userid (called a CADRE number by the Ottawa Force) plus a current password,
you will not be able to monitor any data. I believe that the local system
runs at least 9,600 baud. The calls can be monitored via the mainframe system
currently a DEC VAX system, but only certain people within the comm centre
or the Computer Centre can transmit data. This systems can recieve dispatch
calls, and email between other users within the police services. So if I
was working in the HQ's I could log onto a terminal (DEC DT-320) and send
a message to officer X. I suppose you could monitor the system and try to
crack the program, but people have been trying that with number stations
for over 30 years.

5514. Cell Companies Still Mis-informing People

Newsgroup: rec.radio.scanner
Date: 1994-11-15 20:29:35 UTC
From: jocatch@vnet.ibm.com
Message-ID: <3ab5nflNNjde@afshub.boulder.ibm.com>
Source record: 265481

I just called one of the local cellular companies looking for info becuase I am thinking about getting a cell phone. After alot of questions I asked "Is it private? Can people pick up what I am saying?" The dealer said "No. They would need sone pretty sophisicated equipment to do that. About the only ones who could are the phone companies and the government. " Short laugh. "Their power (cell phones) is also too low to pick up."
So according to him, it is completely private.

I called the other cell company and asked them the same question. They WERE honest and said that "a few people have the equipment needed...". So I said "Then I shouldn't give out confidental information over the phone, like my VISA number?" He said "No."

5520. Q: Good antenna for airplane use

Newsgroup: rec.radio.scanner
Date: 1994-11-15 22:01:49 UTC
From: pwd@apple.com
Message-ID: <pwd-1511941401490001@17.130.21.104>
Source record: 265585

Hi,

I don't mean to re-ignite the scanners-on-airplanes flamefest that seems to have just died down [again] but I DO occasionally use my Pro-43 on a plane and I've found that unless I hold the rubber duckie antenna against the window, I won't receive anything but the plane's own transmissions. Is there a better antenna for use under the circumstances? Is there something I could stick to the window with a suction cup or something, preferably something descrete as well (I don't want to weird out other passengers), that would work better?

Finally, I'm sure some people will also be curious whether the scanner's internal oscilator noise "leaks out" through the antenna, and whether a "better" antenna will affect the amount of potential interference generated.

Any hints would be appreciated,
Thanks,
-Patrick Penzias Dirks.

P.S. Before you spend more bandwidth on this issue,

(a) I KNOW according to the FARs it's the airline operating company's call whether to allow electronic devices on board, but I figure the captain is the PIC and if HE doesn't mind taking the chance, I'll use my scanner, so I

(b) ALWAYS ask the captain before the flight and let him know where I'm sitting in case ANYTHING unusual might happen and usually

(c) The captain will request I keep it off during takeoff and landing but will treat it like all other electronic devices and allow its use above 10,000'. That's actually a recent change (I used to get a blanket OK 2 out of 3 tries) and it's less interesting but it's still a nice way to be entertained in-flight and track our progress across the country. Finally,

(d) If I hear the crew declare an emergency or admit they're lost I'll turn my scanner off :-)

In regards to your question of, how many channels are practical for a scanner. There are several
variables that would determine what is practical for you. such as:

1. How much scanner can you afford?
2. Are you new to scanning and just wanting to try it out. (keep investment down if not sure if you'll listen alot)
3. Where do you live? (Are there 1000 channels of activity in your location? Probably yes!)
4. Do you have one specific thing your only intrested in monitoring. (than a inexspensive unit would do)

My oppinion: A 100 or 200 channel scanners are good values and good entry level hobbist units. However
I would go for a 1000 memory unit if I were rich. I would only get a low end (10 or 20 channels)
if I new that the only thing I was going to listen to was local fire and police. (which is what the
vast majority of scanners are used for.)

Another thing to consider is do you get a hand held, mobile or desktop!?

I have seen ads for cordless outdoor antenna but it has been a long time ago
and I don't remember where it was.

You could do the following - open the case and disconnect the lead to the base
unit whip antenna. Get a length of the best coaxial wire you can affort that
will get to the outdoors. Next you have to find the formual to cut an antenna
to the 46mhz range. Then make a verticle dipole antenna from the formula and
then connect it to the coax.

Have fun

Brian

As a former member of the Army I have to tell you that today's volunteers would probably not fire on civilians without damn good reason, and being ordered to do so is not a good reason. Remember how the Soviet Army sided with Yeltsin when the hard liners staged a coup attempt? The US Army would do the same. I can imagine a few scumbags in the service willing to kill anyone but I have to tell you that their fellow soldiers/marines/etc. would make short work of them. I have absolute confidence in the young men and woman (and older models) who serve this country in the Armed Forces.

Re:
Cellular retailers may know, but many don't. Anyway, they will all lie to you, to try and get you to sign up for some onerous cellular service contract. They just want commission.
As far as "sophisticated equipment", next time bring you old Radio Shack hand scanner with you. Pull it out of your pocket, and ask if this is the "sophisticated equipment" they're talking about.
But if it was digitally transmitted cellular, you really would need something sophisticated.
True, the cellular phone companies will be a little more honest, but they'll also tell you it's "illegal", as like that is supposed to bring someone some sort of comfort and security, even though there are probably millions of cellular capable scanners in people's homes right now.

I've heard 900 mhz phones usually have better range than their 46 mhz
cousins. I don't think it's illegal to mount your cordless phone
antenna outside, bit I don't know how much good it will be creating
a larger antenna, considering the high frequencies these phones
operate on. I do suspect you would be violating an FCC rule, if you
decided to create some monster amplifier of 1000 watts, transmitting
your phone call all over the county.
But on my RS-PRO-2006 scanner, I have heard cordless phone conversations
on 46 mhz, that I knew were over 2 miles away, since they said their
addresses. But that is the exception.

: > Thanks, Mike

: National Weather Service forecasts are usually found on at least one of
: these frequencies, depending where you live, and what weather office
: is broadcasting where & what frequency:

: 162.55
: 162.4
: 162.475
: 162.425
: 162.45
: 162.5
: 162.525

: You may find other weather frequencies. I hear several others from where
: I live, which are local airports issuing weather forcasts/conditions
: for pilots.

Well first, I think Mike is talking about data as opposed to voice. As
far as I know, those 162.xxx freqs are all voice.

Second, 147.060 MHz is within the 2m ham band, probably originating from
a local Chicago ham radio club. Thus I would suspect that you are not
likely to find anything like it elsewhere, though YMMV. To my knowledge,
I'm not aware of any widespread implementation of that kind of service.
If you want to look around anyway, here are some line-of-sight ham freqs:

6m 50-54 Mhz
2m 144-148 MHz
220 222-224 MHz
440 430-450 MHz

Hope that helps...

Happily, that's not the case. You can have any channel in the scanner
designated as the priority channel, as Bob explained above. Right now
my priority channel in in bank 5 somewhere.

The modification allows the microprocessor to scan the 800 MHz band, but the scanner contains NO circuitry to receive signals in this range. The mod is useless. Here's something else:

From: randy_ware%nwmail@sparc.ncpa.olemiss.edu (Randy Ware)
Newsgroups: alt.radio.scanner
Subject: A Pro 2021 Mod
Date: 28 Aug 1993 19:08:07 GMT
Organization: NCPA/University of Mississippi
Lines: 23
Message-ID: <randy_ware%nwmail.14.0@sparc.ncpa.olemiss.edu>
NNTP-Posting-Host: rc.ncpa.olemiss.edu

This is a speed-up mod for the slow 2021 that does work. It will increase the scan speed to about 11 channels per second. It has no effects on the delay time.

Unplug the radio, remove the 9volt batt.

Remove the upper case, by removing the four screws on both sides of the outer case, as well as the one screw on the rear apron of the radio which fastens the upper case to this surface.

Lift the top case section and unplug the white plastic two conductor speaker plug, allowing removal of the upper case entirely.

With the scanner sitting upright and facing you, locate resistor R-147 (a 39k-ohm resistor to the left-front of the main board-almost behind the vicinity of the LCD display). Snip the leads at the resistor body with a pair of wirecutters to leave as much of the existing leads as possible.

Solder a 15K-ohm resistor to those remaining leads.

I found this mod in Monitoring times and have done it to several Pro 2021 scanners and have seen no negative drawbacks to it.

I want to add one more note to this mod, Overall what you are doing is
adding 15k-ohm resistance to R-147. For a total resistance of 54k-ohms.
YOU ARE NOT REPLACING THE 39k WITH 15K.

and grep any keywords you deem offensive/rebellious. Heck you don't even
need awk !

5550. RS PRO-43... new model???

Newsgroup: rec.radio.scanner
Date: 1994-11-16 07:27:56 UTC
From: effigy@west.darkside.com
Message-ID: <09gVVc2w165w@west.darkside.com>
Source record: 265618

If anyone can help me out with the cell mods for the Radoio Shack PRO-43 scanner I'd really appreciate it.

I've seen a few old MOD files (dated like 1992) but when I crack open my scanner, things don't quite match... The files I've seen say that there are diodes at positions D1, D2, and D4, and to move the D4 diode to the D3 position. Well, MY Pro-43 has diodes at D1 and D2. D3-5 are empty.

I've tried moving the two (super-micro sized) diodes around to other positions with no luck. Actually, the luck came in the fact that the scanner still works fine after all that mucking around and re-soldering. The end result is that nothing changed.

The scanner is only about a month old, and the salesman(?) at Radio Shack said that the Pro-43 had been re-designed to make modifications harder. He also said that the one I bought is 'probably' still the old 'easily modifiable' version. I've read some rumors to this effect, and that there was some way to tell by looking at the model/serial number of the unit...

Can anyone out there please give me some assistance? I like the scanner, but I'd like it better if it wasn't locked out...

-thanks.

Ron:

Your best bet would be to pick up a copy of the Haruteq frequency guide (Coles & SmithBooks carry them in Ontario) for Quebec and the Maritimes. Haruteq lists all the cellular frequencies used in Canada (they don't change across the country). Set your scanner in "search" mode and start looking. Cantel towers use 880-890 mhz (roughly) and Bell Mobility uses 890-895 mhz (roughly). You can find out the cellualr coverage area by droppin in to your local Bell Mobility or Cantel dealer and picking up a system map. It isn't detailed and it doesn't list sites, but it does show the coverage area. My map shows the cell sites follow the Trans Canada out to Sydney, down to Yarmouth and back up to Wolfville. Parts of Pictou County, Guysborough and the south-central interior are not covered, as is the Cabot Trail and Cape North and the area south of Sydney inCape Breton Co.

Regards,

David Shearman.

Just arrived in the mail: Catalog 1094C from Tucker Electronics.

Check out page 22 where they attempt to get the unsuspecting
monitoring enthusiast to buy the OPTOELECTRONICS DC440
CTCSS/DTMF decoder ($259.00) ...

"Continuous Tone Coded Squelch System or CTCSS as it's
commonly known is being used by more and more non-trunked
VHF/UHF two way radios and public service agencies. What
CTCSS is, is a sub-audible tone that is encoded in a radio
signal."

Ok. Nothing really wrong with that. Read on...

"In order to hear the transmission your scanner or receiver
HAS TO HAVE this tone frequency programmed in. This is
why you can program many police frequencies from your
scanner directory but still hear only silence."

Do you believe this SHIT!?

I'm sure that the DC440 is a fine product but to use the
BLATANT LIES above to get the unsuspecting scanner owner
to purchase one is false advertising at it's worst!!

David B Baker <dbaker@tiger.lsu.edu> writes:

> I'm sorry (I should know this), but what is RPB? Is that a repeater?

Hi Dave...
sorry for the code
RPB = Remopte Pickup Broadcast, ie officially the link from a remote location to the radio studio. Thats more of an assumption on my part, the FCC licenses these 25.xx and 26.xx frequencies in the "BA" or Broadcast Auxilary service. Typically these HF frequencies are bring used as an in-town cue or actuality line. The one in Tampa Florida used to boom into most of the USA. They were a talk radio format with a 30 second delay over the air. SO they put the 25.87(?) signal on the air to give their reporters a "real-time" listening capability so they can come in on cue, not 30 seconds later! Most radio stations use the 161.xx or 450/455.xx band for that purpose, but in metro areas they are very culttered, and may not cover as well as the HF frequencies.
Sorry the long diatribe and the 2 fingered typing.

ANYONE, ANYONE - what station is this?

As I know, the TV Broadcast is using UHF to transmit the signal.
Can I use the TV antenna to receive the UHF signal (around 450Mhz.)?
Thanks you!

I would think that a lightning rod would be important if you were doing this. By grounding the antennas you are actually making a bunch of lightning rods that could not handle a direct strike. A lightning rod mounted above the highest antenna would reduce the chance of a strike to the antennas. ...where is Gary Coffman when you need him ;-)

Not to confuse the issue, grounding the antennas IS the way to protect your radios.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. A new law threatens to outlaw listening to cordless phones, too.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend many of the AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and

usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-43 portables. A number of owners report problems with the Uniden/Bearcat 8500XLT and 2500XLT and new replacement models are rumored.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by

the 1000 channel PRO-2035.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. Modification article files can be copied from

several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains

several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions. |

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use

and the frequencies are displayed with annoying leading zeroes.

Grove enterprises sells FCC license information on floppy disks. Disks for each state are sold separately, and the information is basically the same as the FCC "state sort," i.e., transmitter location (state/city), callsign, licensee name, and type of license. Some hobbyists find Grove's DOS access software is easier to use than the PerCon CDROM access software.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I offer a service which locates FCC licensed and selected | FAA transmitter sites in an area of your choice, and | produce a custom color map. I call this new innovation | RadioMap(TM) service. It allows you to identify antenna | sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, | RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being

placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the

ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for

membership. (Note: This file will not be sent back to
*.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is
the foremost club for scanner radio hobbyists in the
northern Illinois area. CARMA was formed from the Chicago
chapter of the Radio Communications Monitoring Association
(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but
the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6
times a year. Although lunch starts at noon, the meetings
begin officially at 1 PM and often run until about 4 PM.
You must purchase a lunch since we get the room for free.
Meetings consist of a quick review of club business,
sometimes a special presentation, and a "round table"
discussion/question & answer session. Large quantities of
information and frequency lists are often distributed in
the form of free handouts. Members sometimes sell radio
equipment at the meetings, too.

In addition to regular meetings, there are two CARMA
picnic/field days during which members meet at a park,
erect antennas, eat, and operate scanners from battery
power. CARMA members take organized tours of various
communications facilities in the area.

Club meeting dates and times are published in the CARMA
newsletter, published 6 times a year. A one year
subscription is available by mailing a $10 check, payable
to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer
bulletin board, run by Will Sperling. If you have a modem
and terminal or computer, you can reach the CARMA BBS by
calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of |
1994 and 1995. All meetings will be held on Saturdays at
the Destiny Restaurant, 1440 Rand Road, Des Plaines, IL:

December 10, 1994 |
February 18, 1995 |
April 15 |

June 17 |
August 19 |
October 14 |
December 16 |

Bring a notebook and your appetite.
--

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells the information on PC floppy disks for each state instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The DOS access software is somewhat difficult to use and the frequencies are displayed with annoying leading zeroes.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

I offer a service which locates FCC licensed and selected | FAA transmitter sites in an area of your choice, and | produce a custom color map. I call this new innovation | RadioMap(TM) service. It allows you to identify antenna | sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, |

RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are

given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by

dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi

antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

The PRO-43 is discontinued folks, and the ones that are floating around are of
the non-celluar-modifiable type. The PRO-62 looks like a GRE product, and
essentially functions exactly like the 43, however the case is different, and
there is no military air band. Not have military band is a strange move by
GRE, no legislation forbids military-air-capable scanner production.

I just picked one up used yesterday. I was wondering if there are any mods
available for this model. I have an old post of md files and this is what I see:

```
-rw-rw-r-- 1 root 1602 Aug 3 20:04 pro2026.mod
-rw-rw-r-- 1 root 1201 Aug 1 17:20 pro34.mod
-rw-rw-r-- 1 root 16381 Aug 3 20:04 pro37.mod
-rw-rw-r-- 1 root 5295 Aug 3 20:05 pro38.mod
-rw-rw-r-- 1 root 2248 Aug 3 20:05 pro43-2.mod
-rw-rw-r-- 1 root 2613 Aug 3 20:05 pro43-3.mod
-rw-rw-r-- 1 root 5608 Aug 3 20:05 pro43.mod
-rw-rw-r-- 1 root 4237 Aug 3 20:05 pro43.smeter.mod
```

Is this list old or is the pro39 unmodifiable?

This is at the site: ham.eetech.mcgill.ca:/pub/ham-radio/mods
which I am unable to access via ftp or telnet-- anyone else have any luck?

I am involved in editing the callsigns list that Steve Douglass maintains in his Intercetps newsletter. I
would like to hear from anyone who can tell me the callsigns, types of aircraft and the unit they are
assigned to from the various military bases around the US.

I monitor Hill AFB in Ogden, UT. They fly mostly F-16's. Callsigns from the 419th FS are THUD,
CYBORG and ALTA. The 388th FS has many including, CORVETTE, KNIFE, JASPER, SPIDER,
AIRGUN, ICEMAN, JASPER and others.

I would appreciate any input either here to via e-mail. Thanks a lot.

1/5 watt switchable
DTMF Keypad built in
PL Tone board
High Gain antenna
Speaker Microphone
Heavy Duty Leather Carry case
Swivel Belt loop (allows for removal of radio from belt with 180 degree turn)
FNB-21 9.6V 600mAh Battery with wall charger

Radio is in like new condition. Never had any problems with it.
The purchase price for everything listed above was about $800.
I am selling the whole package for $450.

Email me direct for further questions or inquiries.
drussell_su@acad1.mtsu.edu

Thanks
David

Do yourself a favor buy a BearCat BC 2500XLT and stay away from Radio
Shack. Good products, bad salesdroids. Most of the RS scanners are
Unidens with a lot of capabilities taken out. I have had absolutely NO
intermod problems with this radio and I live in the San Fernando Valley,
and frequently visit friends in downtown Los Angeles. I have owned a
total of 20 scanners and this is the one I have kept!
Features that I love:
400 Channels-20 Banks of 20 Channels
100 CPS search speed
Wide Coverage-25 Mhz to 1.3 Ghz
Autostore- It will scan and enter in new frequencies by itself.
Frequency Check- When entering in a new frequency it will check it
against its internal database and tell you what channel it is in if has
been programmed in before.
Very good backlight
10 Priority channels
Ability to Send freqs to other channels once they are programmed
in.-Another Cool Feature!
Built in Weather Scan
Rotary VFO Knob-Tune by Freq, or by channel.
Comes with Case, AC charger, and Earphone.
Too many other features to list!
This radio is available at many places at discount (under $360.00)
If you need additional info please feel free to contact me at:

>cross-posted it to .shortwave.

Because the original poster had a reference to rec.radio.shortwave in the
header of his message. I did a follow-up. It posts to the same groups.
My message would not have reached the persona to whom I replied if I
didn't cross-post. Not to mention the fact that I didn't see the header
until after the message had been sent.

Perhaps it should not have been posted to the shortwave groups. But it
has relevance in the scanner groups and I would like to see more of these
posts in the future.

Just what was changed after they added the A? Did they just hack off
the D3-D4 section of the board or was there significant rewiring? If
you had a PRO-43 with an A in the serial, could you put a diode in
across one of the leads somewhere (it probably wouldn't be as secure or
good as if done with an older model, but if you are just trying to "force"
the scanner to pick up cellular, lets say) or would you have to build
a whole new circuit board? (and if you're building the board, how big
would this board have to be - what stuff would need to be on it?)

Richard,

It sure does take a warped sense of logic to come up with that statement. Either that, or you just didn't stop long enough to digest what you read. Maybe the word "please" in the second sentence would have softened it (and made it more understandable to you).

147.060 is a amateur 2-meter repeater output. Apparently you were
listening to an amateur radio operator rebroadcasting somebody's weather
service - perhaps NOAA ?

5589. New Uniden/Bearcat scanner models

Newsgroup: rec.radio.scanner
Date: 1994-11-17 00:38:59 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <CzDz50.GG@nntpa.cb.att.com>
Source record: 265510
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Uniden has 4 new model scanners coming out:

1. BC9000xlt - base/mobile unit which looks like an
8500xlt. 25 - 550 and 760 - 1300 MHz minus cellular.
500 channels in 20 banks. TurboScan & Search.
Automatic sorting of freqs within each bank for faster
scanning. Selectable mode AM, NFM, WBFM. 10 priority
channels VFO knob. Selectable attenuator. Data skip.
Audio freq sound control (low pass filter). LCD dot
matrix display. Alpha display Automatic store. Aux
control of external devices like a tape recorder.
Count feature. CTCSS board and mobile mounting
bracket optional. I want one. :-)

2. BC3000xlt - hand held unit which looks like a 2500xlt.
400 channels in 20 banks. TurboScan & Search.
Automatic sorting of freqs within each bank for faster
scanning. Automatic store. NiCd pack. Selectable
attenuator. Count feature. Selectable modes: AM,
NBFM, WBFM. 10 priority channels. Selectable tuning
steps: 5, 12.5, 25, or 50 kHz. I want one of these, too.

3. BC80xlt - portable with 50 channels in 5 banks.
Covers basic scanner bands including 800 MHz, but
excluding commercial and military aero bands. Powered
by 4 AA alkaline or NiCd batteries.

4. BCT7 - BearTracker 800. mobile/base unit with
serveral service search features but no numeric
keypad. Should appeal to truckers. 100 user
programmable channels.
"Highway Patrol Alert" when you are within 3 miles of
a highway patrol unit using a Mobile Extender.

I run a Pro-2006 with several mods a la Bill Cheek with a Grove Scan Antenna and am experiencing front end loading manifest as Intermod pounding into my reciever on certain frequencies I monitor. Is there a simple, cost-effective solution to this front end loading that will not decrease my scanner's sensitivity or reception? I've heard of filters and various devices, but could someone enlighten me as to what is *really* the best solution, or recommendation.

Thanks

: Forget U.S. troops, it is the BATF that we should worry about. They
: kill innocent people every day, just because they legally own guns and
: the BATF arbitrarily decided they should not.

Hey, right arm brother!! But the bad news is they are just using firearms
as a training exercise. Their real goal is to take our scanners and kiddie
porn from us! I know, those suckers are hiding out in the bushes around my
house all the time. I heard they have people monitoring the Internet to
get the names of people that talk about guns and scanners. They then fly
elite troops from area 51 in stealth troop transports and these suckers
parachute into your yard and hide in the bushes. Want proof?? The ones in
my backyard monitor 162.475 on their radios. Yea, you got it, the
National Weather Service. The FEDS!!! Don't you wonder why you can hear
these stations from anyplace in the United States? What the hell for???
You can get the weather on Channel 33 or 17 anytime you want. Tune KIRO
News radio if you want the weather. NOOO! They need them to send coded
messages to the trained snipers. Hey! Don't get any ideas about blowing
up a National Weather Service transmitter. Won't work, they will just
switch to WWV. Listen to it sometimes. Underneath WWV's signal you can
hear some female government bimbo giving out coded instructions. I know
I've heard her. When the Internet goes dry for the Feds they get lists
from Monitoring Times, Popular Communications and Radio Shack to pinpoint
scanner owners. Sure they do, they pretend to be advertisers and need new
mailing lists. A lot of that radio related junk mail you receive is
really sent by the Feds. Next time you get that extra or duplicate junk
mail you can bet that one of them has a bug or an electronic scanner
detector in it. THAT IS HOW THE FEDS GET IN YOUR HOUSE!!! I don't allow
any mail in my house at all. I knew a guy that found a remote television
camera and transmitter in GRE catalog. Ain't gonna happen to me! Now you
have been warned. When those boys start dropping scanner owners like fish
in a barrel don't say I didn't warn you!!

****
When guns are OUTLAWED only OUTLAWS will accidently
kill their children and loved ones.

Temperature inversions greatly affect VHF signal propogation. They are
common in the SF Bay area in the summer. I'd guess that the reduced
incidence of them as winter draws nearer is responsible for the
reduced range you're experiencing.

: Radio Shack and the fines levied against employees who talk about mods to
: their products.

: I confirmed lastnight with the manager of the store where I work part-time
: that Tandy Corp. puts a $5000 fine up on an employee who gets caught talking
: about how one could modify one of the RS house brand scanners (etc...) for
: picking up cellphones.

: I can't help but wonder why Tandy is so worried about that.

Simple, Tandy sells more cellphones than scanners (my assumption) and they
don't want anyone gumming up the works for them.

I can't help but wonder about the legality of Tandy levying a $5000 fine
on an employee! If one were hit with this fine, it would probably be more
cost effective to quit and find work elsewhere. Hell, with their wages, it
might be more cost effective to quit, fine or not! ;-)

Either way, it's a great story. Where is he?

The infamous New York Magazine article is up at
http://dailyplanet.com/moose
for anybody who may be interested.

Actually, there was a long profile of N2KS in the New Yorker (different magazine) a couple of years ago, in which he said he said "the best way to prepare for doing business in Russia would be to spend a year as a roadie for a rock band. You know, the concert is about to begin, and the microphones are dead, and the amplifiers are dead, and the instruments are lost, and the lights don't work, and the lead singer is in a coma --- and you have five minutes to fix everything and all you have is a pair of pliers and a roll of duct tape."

Then he said everything he's done with satellites is "just up the band from 20 meters." Somone tell Wayne Green!

I have a Pro-51 with a date code 7A4 and it would not take the test mode
1(2 key, 9 key, and L/O key)

Here is how to get around that.
While test mode 3 (Band key, 2 key, 9key) is running (display check),
Press and hold down the 2 key, 9 key, and L/O key and within a few seconds
the freqs. from the test mode 1 will appear.

ch 23 is cell phone freq.

2. BC3000xlt - hand held unit which looks like a 2500xlt.
400 channels in 20 banks. TurboScan & Search.
Automatic sorting of freqs within each bank for faster
scanning. Automatic store. NiCd pack. Selectable
attenuator. Count feature. Selectable modes: AM,
NBFM, WBFM. 10 priority channels. Selectable tuning
steps: 5, 12.5, 25, or 50 kHz. I want one of these, too.

The features sound a lot like the 2500 as well. From the description you give, it sounds like a similar radio with a firmware update, the difference being the selectable mode. I think the 'Automatic store' is there as well, but may be called something else in the 2500.

Any idea as to how the RF sections compare?

Anyone recall an article in Monitoring Times that mentioned the intercept of a phone patch from a SAM misssion that discussed disinformation concerning a sighting of secret aircraft. Believe that the person making the call was from the Joint Chiefs of Staff... and included a transcript of the conversation.

Anyone recall this item or have the month/year in their database???

Thanks in advance.

-=> Quoting BNX to All <=-

BN> While the proposal died with the most recent legislature I was
BN> wondering if anyone know if Tom Cross intends to reintroduce the
BN> proposal next year. I read in todays Chicago Tribune that Aurora IL is
BN> going to purchase a new radio system for the police. Mr. Cross'
BN> proposal was to help protect the Aurora Police radio transmissions from
BN> interception from the gangs. Wouldn't the new system solve this
BN> problem provided the right equipment (trunked or encrypted) is
BN> selected??

Well, last I heard of the bill, Ted Moran of CARMA was supposed to get a re-write of the proposal. By then, some strange things happened, one of them being that all of his aides quit. <g> Then the democrats gridlocked the house and the bill was never re-introduced. Peter Roskam, my representative, assured me that the bill would not pass in the form that it was presented.

The new system is on line now! The public works dept is the only one using it currently, with the police switching over sometime next year. With all of the problems with the gangs in Aurora, it wouldn't surprise me if they did encrypt their signal. However, I belive the trunking system would make it more difficult. If you have a current copy of Police Call for IL, you will find the new freqs listed in the book.

If you live in the Chicago Metro Area, you may want to give the CARMA (Chicago Area Radio Monitors Assoc) BBS a call and checkout the newsletters. 708-852-1292. 8-N-1 format, 2400 baud maximum access rate.

>

The only non "full" coverage receiver I can think off as I type
this that would do 217MHz is the SONY PRO-80 which goes 150KHz - 225MHz.
This though is primaraly (sp?) a handheld HF receiver that will also
cover 108-225MHz with the use of a supplied convertor. I wouldn't
like to say how successful it would be for tracking though. They
are still available "new" here in the UK and I assume in the USA but are
expensive - secondhand they can be a good buy if they meet your needs.

Other that that keep an eye out secondhand for anything like the
AR1000/Fairmate HP100 (Same radio), AR1500 (not the best choice).If you see
a Yupiteru MVT-5000 or 7000 in the USA they would be a good choice
if within your spending budget.

5606. My BC8500 Is Not Scanning Fast

Newsgroup: rec.radio.scanner
Date: 1994-11-17 13:18:30 UTC
From: jocatch@vnet.ibm.com
Message-ID: <3afl76INNff5@afshub.boulder.ibm.com>
Source record: 265287

My new BC8500 does not appear to be scanning very fast. Uniden claims that in TURBO mode it will scan UP TO 100 chans/sec. Mine is taking alot longer, going by the flashing bank indicators. It is only a little faster than non-turbo. Even in turbo, I would guess it is only about 30-40 chans/second.

Any other 8500 owners out there seeing this problem? How does one program the scanner so it scans at 100 cps? The scanner already sorts the freqs before it scans so I don't know what else to do. And yes, I disabled priority when I did the measurements.

Any ideas?

Joe C.

5607. Poughkeepsie, NY Police Have Gone Trunk

From: jocatch@vnet.ibm.com
Message-ID: <3afm04INNff5@afshub.boulder.ibm.com>
Source record: 265288

For all those living in the Poughkeepsie, NY area who monitor the Poughkeepsie police, as of about 2 weeks ago they have gone to an 800 mhz trunk system. I just found this out last night and was able to find 3 of the freqs between 852 and 855 mhz. I was told that currently there are 5 freqs in use by I believe Pok Town police and Pok City fire. The old 460 mhz freq are still in use but more and more will be shifted to 800. Dutchess County fire is not going 800 trunk in the near futrue I was told.

FWIY.

NOTHING you can do can protect you from lightning!!!
I tried installing a _12_ foot 2" wide grounding rod stuffed into the
ground with number 00 wire connecting it to the antenna mast.

The result.... Fire ball droped out of the light socket and danced
on the floor for several seconds, CB's, blown apart, Stero equipment
in far side of basement had their power switch welded "on", and
started playing when the power came back up. The old antenna elements
were melted into funny little shapes.

There are certain laws of current flow....Lightning does not
follow them, SORRY!.

I disconnect antennas where they come into the house _before_ the
thunder starts, once you hear thunder, leave it alone.

Once you have a cellular frequency on the display, store the frequency in a
memory location and use the DIRECT key to search up or down from that
frequency. This way you never have to do the reset again.

> I live, which are local airports issuing weather forcasts/conditions
> for pilots.

Well, the frequency you gave above is in the 2 meter Ham band, and I'm wondering if some Hams didn't organize a Skywarn program on a local repeater. These "nets" are popping up all over the place recently -- there's one here in Cleveland on 146.760. Akron, just to our south, has their own, as well as some others along the Lake Erie shore. As they become more sophisticated, they even tie together to form a net with wider coverage. The local Skywarn also ties into the National Weather Service office at Cleveland-Hopkins airport for periodic announcements, but a lot of what you hear are Ham operators in their cars in the midst of the horrible weather. When they give their location, you know precisely where the worst of the weather is.

Not everyplace has Skywarn nets, and the U.P. is not that densely populated, so perhaps they don't. If you have a local Ham radio supply store, you might call or drop in and ask. The sales people there should know about the local ham community.

Ed Lieser

>might be more cost effective to quit, fine or not! ;-)

I was told by a RS salesclerk here in Ottawa, Canada that they are threatned with a Cdn$4,000.00 fine for the same offence. Since IT IS NOT ILLEGAL TO MONITOR ANY FORM OF RADIO COMMUNICATIONS IN CANADA this is pure Bull*** I can only surmise that it is because Shack sells cellphones, and all cellphone providers have always pushed cellphones as being safe and secure...oooppps cellphone is radio... so they lobbied congress and rammed through both the ECPA plus the April ammendment, now they are trying up hear in the Great White North (Canada) to get a Canuck version of the ECPA...

>then connect it to the coax.

That will work for the technical question of adding an external antenna -
here's the legal side.

Cordless phone are built to comply with Part 15. Part 15
requires that the unit be designed so that only the supplied antenna can be
used. It can be designed so the user can replace a damaged antenna but it
requires the use of "unique" connector systems to be compliant. This is why
you don't see cordless phone antennas using BNC, TNC or RCA type connectors.

If you modify the base or handset (since they are both "intentional
radiators") you will void the type acceptance.

Remember that using an external (or remote) antenna may cause more
interference for others and yourself. Part 15's requirements are intended to
keep some of this in check.

>: that Tandy Corp. puts a $5000 fine up on an employee who gets caught talki

As an attorney since 1973, I can tell you that no company can do this.
It would violate Federal Law. Only taxes and certain other things can be
deducted from an employee's paycheck. A company imposed "fine" is not
one of them. The only remedy RS would have would be to discipline an
employee by firing him/her.

If you live in the area go to Hirsch's Electtronics at 219 Califorina
in Williamsville. They are in their 20th year of publishing what has to
be the most comprehensive freq guide anywhere in the country. This 10$ guide
has EVERYTHING you will ever need. Buffalo Bills to Cattaraugus Indian
Reservation. If you live in Erie, Niagra or surronding counties, you cannot go
wrong
with this thing, forget 'regional guides'. No I don't work for them but I've
been using their Guide and have had hundreds of hours of great fun because of
it with my little Radio Shaft scanner.

I remember about 6 months ago, someone suggestion some files to download to learn about the frequency allocations for Cellular. I was wondering if anyone know of where I can get more detailed information on internet regarding the operation of the cellular network. A project I am about to work on would be enhanced if I have a better understanding of how the current Cellular network works today. Since I saw this message on this group, I thought I would post this message here.

Write to:

thweatt@cig.mot.com

5634. Idea for Tracking Trunking

Newsgroup: rec.radio.scanner
Date: 1994-11-18 01:08:41 UTC
From: starin@netcom.com
Message-ID: <starinCzFv6H.Dzr@netcom.com>
Source record: 265307

An idea flashed through my mind today which may make it possible with anyone with a sound blaster card and voice recognition software (Voice Pilot, for example, from Microsoft) to interpret those digital trunking codes that have information about switching channels. The idea is this: with voice recognition software one "trains" the software to recognize a sound (usually a voice) and then once recognized, perform some action. Why couldn't one train the software to recognize digital bursts of data and their associated meanings. For example, if "Zzzt" means go to channel 2, and "Zzzzzzzt" means go to channel 3, then you could theoretically train the recognition software to display on your screen a channel number. Obviously the human ear is incapable of detecting the minute differences between "Zzzt" and "Zzzzzzzt", but perhaps the right voice recognition software could. The downside is, I don't know if the voice recognition software commercially available can really detect these minute differences, but with a little processing, perhaps it could. And, of course, you have to figure out what the variations of "Zzzzt" mean. Since trunking doesn't use the wide range of channels that say, cellular does, it shouldn't be too difficult to do.

Well, that's the idea - now hit me with your criticisms and recommendations.

Sh> Haven't heard of one. A fellow in Toronto just got a full list of
Sh> Ontario frequencies from the DOC on 9 track computer tape. He had them
Sh> transcribed onto DOS disks. The file for Ontario alone is 40 meg! And
Sh> the DOC did nt include the police frequencies... he's applying for
Sh> those under the Freedom of Information Act and says the Privacy
Sh> Commissioner has encouraged him!

Two BBS's you might try are the Ontario DX Association in Toronto and the
Project X BBS in Brampton. Sorry I don't have the numbers handy but could
get them if you're interested.

There is a database called 'Scantrix' which has many Ontario frequencies,
it's on the BBS I subscribe to and probably on the Project X also. The file
from the DOC will be on the OXDA board shortly I believe.

5640. Scanners Across the Water, Or, Is Proscribed Technology Importable?

Newsgroup: rec.radio.scanner
Date: 1994-11-18 04:45:52 UTC
From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <541VEZY.gregmason@delphi.com>
Source record: 265275

I just picked up a copy of a British magazine entitled Shortwave Magazine,
at my local bookstore. Inside, I found all kinds of interesting information
regarding scanning on the other side of the puddle. Seems theyre not really
supposed to be doing it over there. Cool. Anyhow in addition to the interest-
ing perspective Shortwave Magazine gave me, there were lots of neat advertitise-
ments. With all kinds of radios I have only read about on the net before now.

My question is this: Can these radios be imported? How? Does anyone here
have any first-hand experience with importing full-coverage scaning radios
m the UK? Please share your experience in these matters
with me.
Thanks.

Ten years ago the LA County Sheriffs began using a system that an
acquaintance of mine said was not secure at all - his claim was that
anyone using a scanner with the audio run into an apple II cassette
port, and programmed to display synchronuous ascii could monitor it.
He did not comment on the baud rate, but I would suspect 1200.
Apparently the "EDS" equipment used the same audio tones as the Apple
cassette.

That's all I know, as I lost track of him a few months later.

Source record: 265286

Here in Toronto, the Environment Canada broadcast on 162.400 includes a periodic data burst. All I know about it is contained in the blurb that used to follow it. (I haven't heard the blurb in months, but the data burst is still there.)

The tone you have just heard is a digitized data burst called WeatherCopy. WeatherCopy is an innovative service providing printed weather information to listeners in the Toronto Weatherradio broadcast area.

The data burst consists of several tones of rapidly increasing pitch, followed by several bursts of quasi-white-noise. I would assume that the opening tones allow some sort of modem to identify, and hence to decode, the data burst that follows.

I believe I've heard the same tones (but never the explanatory blurb) on other Environment Canada broadcast stations, possibly only in Southern Ontario; I don't remember ever hearing it in the US. Has anyone else heard something similar?

Go ahead and try it. You will get some gain at CB freqs, and maybe at multiples of 27 MHz also, but at all other freqs it will act just like any piece of wire stuck up in the air. If all you have now is a rubber duck, you'll proabably come out ahead.

Yep, it's called Autostore. The only difference is the Selectable
attenuator and Selectable modes: AM, NBFM, WBFM. Firmware upgrade, NO
CELL MODS! (maybe shoot lasers into the chip!) Not worth the money! C'mon
Uniden, how 'bout 1000 channels, backlit keypad, Alphanumeric Display,
and Computer Control! Don't let the AR 8000 steal your thunder.

>listening to an amateur radio operator rebroadcasting somebody's weather
>service - perhaps NOAA ?

Actually, an amateur in the Chicago area re-broadcasts portions of the NOAA weather feed via simplex over this frequency. The data is received by satellite dish, filtered by a computer program, and re-transmitted over 147.060 as 300 baud ascii data. A 300 baud modem in "originate" mode can decode the FSK tones just by hooking the speaker leads into the RJ11 jack and issuing the appropriate AT commands to put the modem in 300 baud mode and take the modem "off hook".

Old Tandy Color Computer modems are commonly sold at hamfests around here just for that purpose. I've been using an old scanner with one of these modems for several years. There's no error correction as with packet, but with a good antenna, it works pretty well. During tornado season, it`s great!

5655. Cellular antenna for scanners

Newsgroup: rec.radio.scanner
Date: 1994-11-18 17:31:19 UTC
From: gt8303a@prism.gatech.edu
Message-ID: <3aiod7$58r@acmey.gatech.edu>
Source record: 265291

I am new-ish to scanning. I have had a couple of scanners for
a month or so each over the last two years, and have recently
found a possible source for a PRO-43 at a good price. I have
a question about an antenna for my car. The previous owner
(my mother) had a cellular phone with a trunk-mounted antenna.
I am wondering if it would be possible/advisable to use that
antenna with a handheld scanner, while I am driving in the car.
I have seen the mounts that clip over the window edge and have
a BNC connector for the small antenna that the PRO-43 comes with,
but if I could use the cell antenna, I figure I'll get better
reception. True or false, and why? Thanks for your time and
expertise.

>probably be the Drake R8.

Brett described my setup exactly (you haven't been peeking in my shack, have you?). I have my FRoG 100 on the bottom with the front-elevating foot extended and the PRO2006 flat on top of that. The FRoG has a bigger footprint so reversing the order wouldn't work too well, not to mention that with the RS on the bottom the antenna hole would be covered (if you're not using an external). Both use RS Minimus 3.5's as external speakers (can't stand the top-firing builtins, especially since the FRoG's would be buried in this setup) which are the icing on this layer cake. If you set the volumes right you can have a SW program running and have the scanner break in when there is activity.

Works for me.

I don't think you can beat the FRG-100 for the money in the table-top range. The sensitivity is excellent (I'm using a 140' wire fed through an MLB and RG58 coax, don't forget to buy the lightning arrestor!) such that I usually have the attenuators on to keep the S-meter off the right peg. The lack of a direct entry keyboard (which can now be fixed by the availability of two add-ons - one of which Universal can sell you at the same time as you buy the radio) has not been a problem since you can probably hit the FAST button and spin the VFO knob to get where you want to go faster than hunt-and-peck keying. The selectivity should be better than the unit I got since Yaesu admitted that the filters they were using were crap and upgraded the design (but not until after I had installed a KIWA replacement set :-( ).

If you are using an external antenna, maybe you should check your connections. In my experience, reception is getting better - I am hearing dispatch and mobiles of a PD over 80KM away breaking the squelch on one of the channels of our local PD. This didn't happen last month but has been pretty consistent this month.

you're inside a metal tube. RF from the outside just isn't going to penetrate
very far inside.

> Is there a better antenna for use under the circumstances? Is there
> something I could stick to the window with a suction cup or something,
> preferably something descrete as well (I don't want to weird out other
> passengers), that would work better?

No. You need to get the antenna outside the airplane. Since that isn't
likely, against the window is your only hope.

> Finally, I'm sure some people will also be curious whether the scanner's
> internal oscilator noise "leaks out" through the antenna, and whether a
> "better" antenna will affect the amount of potential interference
> generated.

yes, and in general, yes.

the funny thing about all this is that, given the IF frequencies used,
I'd expect a scanner to bother the airplane's electronics far less than an
FM broadcast band receiver (eg Walkman).

> (a) I KNOW according to the FARs it's the airline operating company's call
> whether to allow electronic devices on board, but I figure the captain is
> the PIC and if HE doesn't mind taking the chance, I'll use my scanner, so
> I
> (b) ALWAYS ask the captain before the flight and let him know where I'm
> sitting in case ANYTHING unusual might happen and usually

Nice gesture, but the captain isn't usually qualified as an EMI expert.

If *your particular* scanner and antenna combo hasn't been accepted as safe to
operate during flight, I'd be happier if you kept it turned off.

You see, it isn't that the risk of the scanner causing a problem is so great,
but that the magnitude of the potential problem is so large. Would you play
Russian Roulette with a ten-thousand round cylinder and just one bullet loaded?
Maybe you would... but would I give you permission to play on my behalf? Nope.
Not even with a million-round cylinder.

USAF AMC transports use REACH XX. But they can also use the last five of their serial.

Others I've noted:

KING XX for the 129th RQS at Moffett NAS, (C-130s, HH-60s)
FIREBIRD XX for VA-304 at Alameda NAS, (A-6s)
The Navy C-9s at Alameda just use their tailcode and nose number.
SHOOTER XX for VMFAT-101 at El Toro MCAS, (F-18s)
SMOKE XX for VMFA-134 at El Toro, F-18s
RAIDER XX for VMGR-352 at El Toro, KC-130s
ANTLER XX for HMM-166 at Tustin MCASH, CH-46s
WOLFPACK XX for HMH-466 at Tustin, CH-53s
WARHORSE XX for HMH-465 at Tustin, CH-53s

mmm, that's about all I can think of for now off the top of my head.

all of the jumper locations are there (1-5) but there's only two diodes
on the board... I haven't tried jumping any of the other locations while
the original spots were still connected... I guess that's my next set of
experiments.

Any other suggestions?

The best hacking/phreaking text files and utilities
(wardialers, credit programs, cellular phone programs
and viruses) are collected in the H/P Disk collection-
volume 2.

Easy to use, and includes textfile instructions for all
functions. All files are current NOTHING is older than 1994.

To get volume 2 of the H/P disk collection, send a check
or money order for $2.00 plus $.50 shipping payable to
"JK Micro" at:

JK Micro
13022 Welcome Lane
Burnsville MN 55337-3842

The programs and files on the disks are free-the $2.00 covers disk cost.

you should get them to first tell you what constitutes "high performance"
ask them what advantages their antennas offer over the standard duckie or
whip:

I've seen their product and as far as I am concerned it is designed to look
cool and that's it. Usually the problem wiht 800mhz signals is not that that
they are too weak, it is that you have intermod and other trash around.
An antenna that offers gain is not that useful on local stuff, and it is
not clear to me that the antennas really offer gain. Again, they
are designed to look cool.

I'm looking for any mods for my old Radio Shack Pro 2020. I'm also having some problems with this old scanner. The display sometimes just goes blank and I have to turn the thing off and on rapidly several times to get it to come back on and work right. Sometimes it loses the freqs in memory when it does this, despite a good battery. I opened it up and did a visual inspection for poor soldering, cracked pc board, etc. but I don't see anything amiss. If any of you here have had a similiar problem or symtoms with your scanner and know what it might be offhand, please let me know. Just thought I'd mention it on the off chance that it is a common problem with (hopefully) a simple solution.

Thanks

5688. Alphanumeric handheld scanners?? WHEN?

Newsgroup: rec.radio.scanner
Date: 1994-11-19 18:12:08 UTC
From: hglassma@daniel.drew.edu
Message-ID: <1994Nov19.181208.113475@daniel>
Source record: 265261

After seeing the posting about the new Uniden/Bearcat scanners, I was disappointed to see that the new handheld scanners still have a standard numerical display.

I have been waiting for a scanner manufacturer to develop an alphanumeric display similar to that used by the Motorola Saber radio.

I know that Uniden made that dash mountable alphanumeric a couple of years ago, but that is not what I am looking for.

Does anyone know of any existing alphanumeric handheld scanners or of any plans to make one?

Thanks for your help!

Greg,
I don't know about all the tech from outside the US but if you
try and import a scanner that can pick up Cellular Phone (800mhz) freqs
and you get caught you will have your scanner confiscated and I think
pay a hefty fine. Of course if you don't get caught you can listen to
those freqs. A more legal solution is to try and buy an old scanner off
someone willing to part with it that picks up the 'forbidden frequencies'.

Allways worked for me. If you are in a car you can't do better than an outside antenna, try to keep the antenna cable as short as possible. This antenna will favor higher frequencies but will work fine for all bands.

From: fk192@cleveland.Freenet.Edu
Message-ID: <3am31f$qh6@usenet.INS.CWRU.Edu>
Source record: 265252

I have a question about marine frequencies. The list that I
have goes from channel 1 to 28 (156.050 -157.400 in .050 steps)
and from channel 60 to 88 (156.025-157.425 in .050 steps).
What happened to channels 29 to 59? Are they not used?
Also anyone have any frequencies used by cruise ships around the
U.S. Virgin Islands. I will be spending a few weeks at a friends
home and will be in sight of many of the ships as they come into
the island of St. John.

> expertise.
>
If you have the time you may want to try an expierment I have
been meaning to do. Hook up a celluar antenna to the feed from
the one one the outside of the car. This should in theory bring the
cell signals in from the outside and reradiate them inside your metal box where
your little scanner can pick them up better.

The advantage to you is that the scanner would be easier to operate
while mobile if it had one less wire connected to it.

If this idea works then I would try it with other bands as it
would be a niffty way of protecteding the scanner reciever from
static spikes that some antennas pass.

This would be a passive antenna system IMHO and the concept is
used in some tunnels to carry outside signals in to vehicles
traveling thru them.

Another extension would be to hook up and antenna witth a siganl
amplifier and then feed another antenna near your reciever.
Get back to me if it works.

The AR8000, from AOR, has an alphanumeric display complete with
7-character memory/bank labels, signal-strength meter, and primitive
bandscope.

5699. Cellular Phone

Newsgroup: rec.radio.scanner
Date: 1994-11-20 01:48:04 UTC
From: samson@no.email.address
Message-ID: <samson.12.0001A774@no.email.address>
Source record: 265269

Anyone know of a good portable scanner that can be used in a car to pick up cellular phone conversations? I'm always interested to know what people talk about on their car phone while driving. I'm conducting a informal survey of what people really use their car phone for (ie business, safety, being cool, ect...) How about jamming these transmissions? Any tips and advice? I mean advice, not warnings about it being illegal.

No flames please! Just serious answers. I will not waste any time with flames so spare me your itch to get something off your chest. All others are welcome though.

Remember, it's only illegal when one get caught. Otherwise, it's just curiosity and thrill. I love this country.

"Sometimes, it does really take two wrong turns to get back on the right track."

I listen in on great lake shipping traffic, I currently use a R.S.
discone and a mon 58.

I am considering something directional but not shure what to look for?

I also wanted to know if a standard boat antenna (fiberglass wip) would
work? I'm about 20 miles from the lake.

Lastly, RadioWare lists a high vhf antenna that can be cut for the
specific freqs. any experience with this type and is it directional?

Thanks for any help, Neil

>>>> I am attempting to increase the range of a cordless phone. I am primari
>>>> concerned with range OUTSIDE the house, and 900 Mhz still doesn't cut it
>>>> First, how much transmitting power do these things have? Also, is it
>>>> possible/legal to mount an outside antenna?

Not sure on legalities, so check w/ FCC office.
(you'd hate to get a fine)

NE>>>I've heard 900 mhz phones usually have better range than their 46 mhz
NE>>>cousins.

True, due to the characteristics of the band - see technical
papers/books at the library for more info

I don't think it's illegal to mount your cordless phone
NE>>>antenna outside,

??

bit I don't know how much good it will be creating
NE>>>a larger antenna, considering the high frequencies these phones
NE>>>operate on.

The frequency doesn't matter... you can construct high gain antennea
that will dramatically improve the performance (but check the laws)
I think that 'can not cause interference' clause will get you.
The disadvantage is cost - the higher the freq, the higher the loss in
coax cable....

I do suspect you would be violating an FCC rule, if you
NE>>>decided to create some monster amplifier of 1000 watts, transmitting
NE>>>your phone call all over the county.

:)

NE>>>But on my RS-PRO-2006 scanner, I have heard cordless phone conversations
NE>>>on 46 mhz, that I knew were over 2 miles away, since they said their
NE>>>addresses. But that is the exception.

Cordless phones have an output of 200mw MAX. the antenna is a 1/4 wave
half dipole and offers no gain. same goes for the base. So the range to
link is much lower than a super het receiver to listen.
Build or buy a directional or 'beam' antenna (similar to a tv ant)
and see how for you can pick them up! Add a preamp - farther!
put the antenna higher... more!

Radio's neat stuff!

NE>>>>Chris,
NE>>>> Whether or not people monitoring police radio traffic can prevent abuse
NE>>>>of police power, it is interesting to know that MDT transmissions can be
NE>>>>intercepted and displayed or printed. For less then US$2000. you can put
NE>>>>the system together. You can also do the same with alpha-numeric pager
NE>>>>transmissions. Of course, that is illegal.

I think only scambled satellite and cellular are the only restricted
receiving areas.
I what you do with what you hear, more that *if* you hear it.
ex:
You'll get in trouble for 'fire-truch chasing'
but you'll never get in the way by monitoring.

>>>Monitor Police MDT traffic ?, for $2000. Tells us more? Like how did they
>>>get around security features like encryption etc etc?

>>>I'd like to how and for only $2000.

>>>Greg

I can be had for less - "i've heard" that you can use a standard pc,
a scanner, and an interface box (basically a packet decoder - FSK)
the boxes are around $100-$200. Most MDT's are not encrypted.
but at 16 digit code will decrypt. (software in place will do this,
but takes time to find the key) 'they' use the DES standard algo,
but subject to change and availability.

Watch the market, it will become available. (then soon to be outlawed)

Mike " 7-character memory/bank labels,"?

Does that mean you are limited to seven characters to identify
the channel you are listening to?

Can the bank have a label also and does that display also
at the same time?

Then you could have

Police
Cobb f1
460.375 on the display? Or does this replace the actual
frequency with a label?

Vic

5711. AR8000 Alphanumeric labels

Yes. I use tricks like mixtures of upper and lower case in order to avoid having to waste a slot with the space character.

>Can the bank have a label also and does that display also
>at the same time?

If you assign an alphanumeric label it is displayed whenever that item is accessed or displayed as a possible choice.

SEARCH banks can be labelled (e.g. call the bank having 46.61 - 46.97 @ 200 KHz "CORDLSS")

Individual MEMORY channels can be labelled. (label memory channel A01 as "SIRTops")

Scan MEMORY BANKS cannot be labelled as a group.

Bummer .
i guess the limit is based on 1234.567 mhz for freg display
If you have a label displaying instead of freq. how do you
find out what the freq under it is?

It would seem that tthe aor8000 would actually display a freq
all the way to 1234.567x MHZ because it resolves to 50 hz according
to this flyer I recieved.

Did you buy the computer interface? I travel alot in my work and I thought
meaningful alphanumeric lables would help when I get
in areas I don't frequent since I can never remember what I
programed a given frequency for.

If you have the ci how long does it take to reprogram all 1000
memories?

Does this scanner have a search lockout list like the aor 1000 did for each search bank. That effectively gave the aor 1000 2000 memories, 100 per search bank plus the regular 100 memories per scan bank. You couldn't handle the extra items in the same way you would in scanning but you could recall those suckers and while they were displayed you heard any activitty on that frequency.

Vic ki4je

```
THE RADIO SPECTRUM
------------------

This is an approximate look, to help in searching frequencies on a
scanner or shortwave radio. Just be aware, having the right frequency
may not be enough, in tuning to a certain frequency. The time of
day, atmospheric conditions, location, mode you're in (AM, SSB,
Narrowband FM, Wideband FM, etc.), and your equipment, are also equally
important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), aeronautical communications (mostly AM),
and some military VHF/UHF (Wideband FM). Most all scanners will pick a
default mode for you, depending on what frequency band you are in. But
many scanners also let you manually switch between modes (AM, FM, etc.)
and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes
are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- ----------------------------------------------

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
```

7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government, weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69, others.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset

frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, depending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communication units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

The frequency is ALWAYS displayed.
If you have programmed an alphanumeric label as well, it is displayed
SIMULTANEOUSLY on a lower line of the display. If you have not programmed
an alphanumeric label, that line is blank. This is a multi-line dot matrix
display, and there is plenty of room to show you everything.

>Did you buy the computer interface? I travel alot in my work and I thought
>meaningful alphanumeric lables would help when I get
>in areas I don't frequent since I can never remember what I
>programed a given frequency for.

I'm not going to buy the computer interface until there is decent software
support (i.e. there is something to **DO** with it - other than post to
the net that I have the computer interface and you don't). :-)

Programming alpha labels is VERY tedious using the bare scanner. You use
the arrow keys as a cursor and scroll through the entire ASCII and Kanji
alphabets using the rotary encoder knob on top.

>If you have the ci how long does it take to reprogram all 1000
>memories?

Don't know.

>heard any activitty on that frequency.

Yes, you can lock-out ("pass") search frequencies and memory channels.

This is a neat feature for those who think about it.
You can within 10 -15 minutes find all the traffic reporters,
planes, helio's etc in a given city by programing tow
search banks 450-451 and 455-456 with limits. Linking those two banks together
and hitting search. Lock out all the immediate garbage or queing channels.
Then as you find each hit, store it and tthen lock it out so
you wouldn't hear it again during tthe search. In a very short time
you will have everyone who transmits something. in a 2 mhz spectrem
even though there is a 5 mhz gap in the area you want to search.
Apply this idea to other services railroads, marine etc.

Regarding the CI to aor 8000 it must come with the ability to
send data to the 8000 and it must come with an interface
to enter that data. To download vast amounts of data just
connect a comm program like procomm 4 win 2.1 and write
a aspic script to do the job with the serial port.

Any language would do the aspic probably would be the easist
to use in a interactive test to start with.

If there is absolutely no software then one could hook
up the 8000 to a serial port. Activate send from the 8000
to send data as a dump to PC4W and capature the data, examine it
as to structure and then write a program that will edit that
structure and send it back thru PC4W to the aor 8000.
This will especailly be easy if the aor8000 dosn't encript
the data or pack it with some compression program.
Just my opinion, I haven't seen anything ofn the computer
interface either other then it will also take data from one 8000 and program
another 8000.

Thanks for the info.

RS>Mods for BC 200xlt wanted. Thanks much.
Uniden BC200/205 Business Band Restoration

Prior to performing this modification take the following precautions to insure that damage does not occur to any component inside of your Uniden scanner.

A) Try to perform the modification in a low static electricity environment.

B) Avoid wearing wool clothing or walking across a carpet (in low humidity areas) as well as touching your scanner or any component inside the chassis.

Required tools: A small phillips screwdriver and a fine-pointed snipping tool.

MODIFICATION PROCEDURE ----------

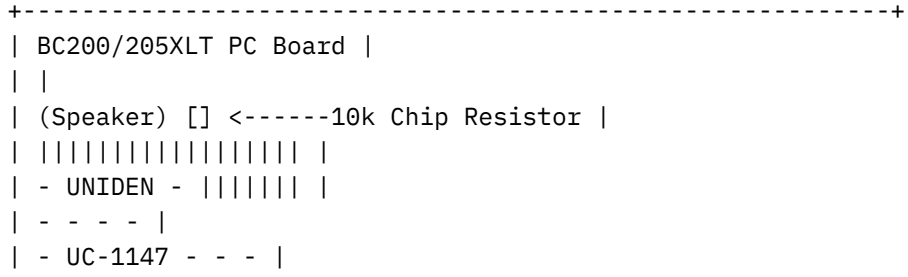
1) Disconnect the antenna and slide off the battery pack from the scanner.

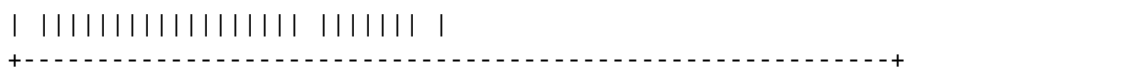
2) Remove the two screws from the back of the scanner plus the two screws that hold the battery pack retaining spring in place as well as the spring itself.

3) Carefully pry the bottom of the rear of the cover from the radio then remove the cover.

4) Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the BASE (the two halves are connected by a plug so their will be some resistance) and separate them.

5) Consult the illustration below and locate the IC labeled "UNIDEN UC-1147" and the 10K chip resistor positioned above the letters "DEN" on the integrated circuit. (The resistor will be color coded brown-black-orange).





6) Using the small wire cutters, cut the resistor in half. (Be careful as the resistor may shatter causing debris to scatter along the PC board). Be sure to remove all left over residue by blowing or brushing it away. The solder pad that the resistor was soldered to may peel up as you remove the resistor. You may peel the pad off if done carefully not to disturb the surrounding area or components.

7) To reassemble insert the top of the front panel into the slot under the volume/squelch control panel while noticing the alignment of the dual in-line connector at the bottom of the board with the mating socket and finally pressing it (the front panel) in place. Be sure that the holes in the PC board line up with the holes in the plastic standoffs under the board.

8) Insert the two screws and gently tighten. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel. Press the cover into place, insert and tighten the screws. Replace the battery retaining sprint with the slotted side facing the notched hole. Insert the two remaining screws and gently tighten them. Slide the battery pack into place and switch the scanner on to make sure the display comes on. If not, check that the battery is charged and/or the battery retainer spring is properly mounted or dual in-line connector was misaligned during reassembly. Assuming the modification and the reassembly was successful, switch the scanner on, press manual, 845.0, E and within a couple of seconds you should see the frequency 845.000 MHz displayed. The modification is now complete!

Try it it is very easy to do.....

RS>Mods for BC 200xlt wanted. Thanks much.

BC200XLT SHORT BATTERY LIFE SOLVED
BC200XLT

It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor provides the answer.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.

SHORT CUT
****THIS IS THE ONE TO USE****

Mark Machcinski of Wyandotte, Michigan, came up with hisw
own solution. He simply soldered a wire bridge across diode
D203, disabling the low battery indicator entirely. The
radio now operates uninterrupted until it blanks out when
the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge
the original diode with a 6.8K resistor, defeating the
premature recharge signal, yet preventing the battery from
too low a discharge.

5726. Has anyone tried SCANPRO?

Newsgroup: rec.radio.scanner
Date: 1994-11-20 20:25:46 UTC
From: ces@christa.unh.edu
Message-ID: <3aobca$uiu@mozz.unh.edu>
Source record: 265333

Hi folks!

Chris Schoenfeld here from Szechuan Software. I was just conducting
an informal survey to see how many people have tried my shareware program,
Scanpro - A frequency database for 400-channel scanners like the PRO-2006.

I have recently fixed a few bugs in the program and am about to
release version 1.3. Here's some changes since the last version:

Highlight-Bar jumping bug eliminated
(Often the highlight bar and cursor would lose each other
when paging through banks)
Multiple-.scn file capability
(Previously you could only have 1 database file)
Introscreen lock-up fixed
(Fancy red-and-blue flashing lights were locking up older
computers-now they don't flash, you can also disable the
intro screen completely in registered version)
Some input code bullet-proofed
(If you entered an illegal character in search mode, for
example, it would list ALL blank entries - FIXED!)

Before I release I want to add the following:

Prompt for save before loading new file or exiting
Fix printing problem (a bitch, since my dot-matrix is dead!)

(Presently I have no hard-returns in the printing code (bush!)
and you have to set your margins to compensate. It is actually
better to use PrintScreen!)

-Chris Schoenfeld
Szechuan Software

5737. Finding Frequencies

Newsgroup: rec.radio.scanner
Date: 1994-11-21 02:43:10 UTC
From: jakst44+@pitt.edu
Message-ID: <3ap1fu$sro@usenet.srv.cis.pitt.edu>
Source record: 265345

Hello. I'll start by stating that this is NOT my account. I do not believe that I will write anything "flame-able", but if I do please don't send e-mail to this address. I'm "in-between" accounts right now and do not want to piss my friend off by filling up his disk space with e-mail. Thank you.

Now, on to the subject at hand. Last week I picked up Radio Shack's digital RF Frequency Counter (cat. no. 22-305) for a hundred bucks. I've never used a FC (freq. counter) before because I'm not too into the technical side of electronics. I enjoy my scanner and understand most of what is written on this newsgroup, except for the technical stuff. I've been scanning for about a year and a half now and have been reading this board for about that long and have picked up a lot of info. from here. Now, I figured that a FC would be the perfect thing for finding unpublished frequencies, such as the kind police switch to when they don't want to be heard and they don't have coded radios. The only real problem with using a FC is that you have to be within about a block's distance of the cruiser when it is transmitting. That isn't too difficult, except the police don't use their private channel, channel 4 in my town (Johnstown, PA), all of the time, so I'll need some luck and a few gallons of gas before I finally get it. Sooner or later.

I was wondering is anyone has tried using an FC for this purpose and if they have I'd appreciate any comments or suggestions to be posted. The FC is kinda weird, though. I had it right beside my cordless phone and the base unit and it would not lock on to the freq., but my Pro-43 was picking it up plain as day. Can anyone explain this? Is the signal too weak for the counter, or is it too close to it, or what? When a cruiser was only about 10 yards in front of me transmitting, the FC locked right on to the police frequency. The salesman at Radio Shack had no clue, go figure.
Also, I had the idea of sitting by the repeater tower. Well, we have two different towers for Johnstown. See, we have a county dispatching center that dispatches everything in the county. That's about 25 miles or so from my town, so we have repeaters set-up on the mountains. One tower is for South operations, 453.375, and the other is for Metro, 453.650. You can drive to within 200 feet of the South tower and whenver they talk, dispatch or a cruiser, the FC locks on perfectly. Now, I was about the same distance from the Metro tower and it wasn't locking on to the frequency as well as it did with the South tower. Should I get closer to the tower, like at the base of it, or what? I was hoping that somebody could explain that. The towers are miles apart on different hillsides.

In the Oct. issue of Pop. Comm. on page 4 Optoelectronics advertises their Model 25 Scout. It is like a 'suped-up' FC. It also says that unlike a regular FC, it can differentiate between random noise and coherent RF transmissions. I was wondering if anyone had
used this, and if so, is it a lot better than the FC I got from RS? I don't

really have the $399 for this thing, but it does have more features and if it would work a lot better than a regular FC for my purposes I would consider getting it. Anyways, it is Christmas soon, right? :)

Well, I hope that this has given someone the idea to try this, and if you have done this if you would post with your ideas and opinions.
My name is Matthew Haslett and as I mentioned this is not my account, so please post any replies to this newsgroup rather than by e-mail.

Thank you all in advance.

5740. PC Display Signal Strength Meter

Newsgroup: rec.radio.scanner
Date: 1994-11-21 03:59:50 UTC
From: starin@netcom.com
Message-ID: <starinCzLn3q.29F@netcom.com>
Source record: 265346

If anyone out there has the Commtronics CE-232 or HB-232 interface I have written a neat little script that uses the OUTBYTE function to create a signal stength meter on your computer display. I'd be glad to share it with anyone who would like it.

While I have your ear - does anyone know of software that will decode paging tones? Or how it can be done?

5742. Tracking Cellular Trunking

Newsgroup: rec.radio.scanner
Date: 1994-11-21 05:50:46 UTC
From: robert1159@aol.com
Message-ID: <3apcfm$gk4@newsbf01.news.aol.com>
Source record: 265349

Was passing through and area of a SWAT situation. The command van was parked and they were negotiating with a man holding up in a house. Anyway the cellular conversations kept trunking among 4 frequencies. What was unusual is that it kept going only to these 4 frequencies during an hour long standoff. One was used much more than the other 3 but it would stay on that frequency for only about 20 seconds and then switch to one of the others.

My question is: Can they purposely program the phones in that van to trunk?
They might want to do that to discourage monitoring but I would think it would get annoying. I tend to think it was just a bad location that happend to be between two cells.

5743. Re: Use TV antenna to receive UH

You might try contacting someone on the tour. They may be hanging our on rec.music.rolling-stones or something like that. They have been posting near daily stuff on the Delphi system.

I went on tour with them for a week on Steel Wheels as security. You will want the building security frequencies and police frequencies. Also, the band will have 6 to 12 frequencies in use. The band should have two security teams with them, a peer security team which works with local venue, police and fire., and a "bodyguard" type security team. The bodyguards are with the band at all times, and are usually on-duty, tour assigned police officers. I remember that LAPD had some officers with the Stones for Steel WHeels. I would presume that peer security would have 460-465Mhz radios, they might be scrambled, but without a repeater, the building dynamics may prevent scrambling. The key to any action will be the venue security, and venue police tactical freqs. If you have a chance, ask a technician in a NEWS VAN. They are scanner gurus.

There's an interesting article on this (could there be a _boring_ article on numbers freqs?) in the March 85 Pop Comm: _About the _Spy Numbers_ Transmissions, by Robert M Dyquetta. He pins the American numbers down to the Remington, VA site of the Nat'l Comm System complex. The Cubana b'casts from Bautu, Cuba, and he gives some more sites, along w/ the usual speculation (pretty well-grounded, in this case). He also refers to the Nov 84 issue (which I _don't_ have), w/ the article _Spy Transmissions -- Operational Perspectives.

: ...where is Gary Coffman when you need him ;-)
:
: Not to confuse the issue, grounding the antennas IS the way to protect your
: radios.

If you look at a lightning rod, you will find it has a sharp point at the top. This is so that it performs its actual function - to bleed off any charge, before it builds up enough to attract a strike. If your lightning rod gets hit, then it is not doing its job.

5753. BC2500 gets Cell. on 23 cm band

Newsgroup: rec.radio.scanner
Date: 1994-11-21 10:42:04 UTC
From: telecom@netcom.com
Message-ID: <telecomCzM5q4.Kvu@netcom.com>
Source record: 265353

few months ago I bought a BC2500XLT with a date code of OGID. Having owned Bearcats previously (the last was the BC200XLT) I was curious to see if a mod. could be made for cellular reception (aka simple resistor cut on BC200).

Thanks to this group, I found the Monitoring Times article (9/93). However, the article mentioned units with date code ending in ID may not be modifiable. Well being the adventurous type (?) I performed the mod. anyway and it was unsuccessful, so I wound up buying the GRE Super Converter II and it worked great.

Last weekend I bought a ARRL repeater directory and was scanning for repeaters in the 23 cm. amateur band (1270-1295 Mhz) and guess what- my BC2500 picks up cellular between 1268-1295 Mhz ! This weekend I drove to Reno with cellular entertainment all the way without the GRE! I wonder if the mod. had anything to do with this? Do I have a "special" unit or are all BC2500's like this? Did I stumble on to something?

Any comments from BC2500XLT users and all?

5754. Re: AOR AR1000XLT

Newsgroup: rec.radio.scanner
Date: 1994-11-21 10:42:59 UTC
From: kjn@netcom.com
Message-ID: <kjnCzM5s2.FFp@netcom.com>
Source record: 265354

E. Stewart asked:
" I am planning on purchasing a new hand held scanner. I am looking
" at the AOR AR1000XLT. Does anyone out there have any comments
" on this model? How does it compare to the RS Pro-43? What other
" scanners would you recommend over this one?

I have both an AOR1000XLT and a Bearcat 2500. I prefer the search mode
and the 1000 channels of the AOR but the programming is not as
straight forward as on the Bearcat. In fact, it can be quite tedious.

If you might feel the need to monitor wireless mics at concerts or the audio
provided in some movie theaters you'll need the programable WFM mode of the
AOR which the Uniden does not have. The TV audio is also nice on the AOR.

The ONLY thing I dislike about the AOR is a brief hesitation while
scanning, on the last channel in the scan bank... a VERY small issue, I'll
admit but it led me to buy the BC-2500 to use for most casual situtations.

For searching, I'll use the AOR. It's ability to lock out up to 100
specified freqs while searching is a great way to get rid of the few
problem "birdies" that you might encounter. Both radios work very well in
the UHF military aviation band which is where I usually prowl.

The main complaint I have with the Uniden is that it requires a dedicated
battery pack (at around $35.00 a pop) and cannot use AA cells. About the
best I get from the BC-2500 is 5 - 6 hours on a full charge.
For me, this is major complaint!

Both have great sensitivity. I think the selectivity is better on the
BC-2500. Haven't tried a PRO-43.

If anyone has schematics for the two versions, it would be
interesting to compare them. If anyone out there can image-scan one
and mail a mono bit-map or other windows-compatible format as a
binary, it might be worth a go.

In the UK, Radio Shack sell through Tandy stores. If they sell the
PRO43, it'll probably get 800MHz already. I'll check (unless someone
already knows).

Not likely - keep in mind that handoffs are supposed to occur whenever the system deems it necessary. The network initiates handoffs and channel assignments. The phones only follow instructions. About the only thing that a phone initiates on it's own is "registration" and dropping calls when it loses SAT.

If the call was handing off between two sites, or two sectors within a site, it would normally remain on just a couple of frequencies if the site wasn't real busy. If each site or sector had one channel set you would be working with about 30 possible channels or less.

> They might want to do that to discourage
>monitoring but I
> would think it would get annoying. I tend to
>think it was
> just a bad location that happend to be between

It's not supposed to be annoying. The phones are supposed to mute the data bursts so that handoffs are transparent to the user. Some networks are better at it than others. It should never sound as nasty on the phone as it does on you scanner.

I would think you are right in guessing that the call(s) was handing off between two sites or sectors.

> or
>wb8vpa@barf80.nshore.org
>

My reference is The UK Scanning Directory
ISBN 0 9519783 2 2

As the marine band is essentially international, the info should be
OK for the US also.

156.0000-156.7500 channels 00 - 15 50Khz step
156.0250-156.7250 channels 60 - 74 50Khz step
156.7625-156.7875 Guard Band (channel 75)
156.8000 channel 16 -
distress/safety/calling coastguard
156.8125-156.8375 Guard Band (channel 76)
156.8500-158.5000 channels 17 - 50 50Khz step
156.8750-158.5250 channels 77 - 110 50Khz step

Many of these channels are worked duplex, the above freqs being
base, with the mobiles between 160.6000-163.1250.

Hope this helps.

Julian

I'm looking to buy a BearCat Scanner. I like the features of the 2500, what's this guy usually run? I've seen the BC 150(?) sport model at best buy, 100channels, for $200. Is this a replacement for the 100xlt? Supposedly it picks up cellular without mods, is this correct? Is there a similar replacement for the 200, w/200 channels? How much is it going selling for?

I'm also looking at getting my No-Code License in the Spring. Should I be looking at HT's with scanning capabilities? Or will I be better off picking up a scanner and a HT?

Thanks for any info.

5766. Info on Cellular Technology

Newsgroup: rec.radio.scanner
Date: 1994-11-21 16:59:21 UTC
From: mlfowler@lfs.loral.com
Message-ID: <19941121.115921.171@lfs.loral.com>
Source record: 265370

I'm looking for recomendations on books and articles that provide info on the technology used for current cellular phone systems. Things I'm interested include modulation types, signaling protocals, spectrums, bandwidths, propagation effects such as multipath, etc.

I know of several books that are published by Artech House... anybody familiar with them?

Any leads would be greatly appreciated. Thanks.

```
|I've seen their product and as far as I am concerned it is designed to look
|cool and that's it. Usually the problem wiht 800mhz signals is not that that
|they are too weak, it is that you have intermod and other trash around.
|An antenna that offers gain is not that useful on local stuff, and it is
|not clear to me that the antennas really offer gain. Again, they
|are designed to look cool.

It depends where you are in relation to the cellular towers; one of the
best units for 800 Mhz use in the 'burbs is the Rat Shack double bow-tie
indoor UHF antenna turned 90 degrees on it's side and fed into a CATV
300-to-75 ohm matching transformer to be fed into your scanner
input...
```

Source record: 265371

Hey, what's the maximum distance you can listen to 800-Mhz Police freqs.? I live in Appleton, Wis., and would like to hear police in Green Bay, which is about 25 miles away. They have just recently switched to the 800 system, from what I understand. I can hear police transmissions in surrounding villages near G.B. that use the standard 150-Mhz band. I understand how the differences in wavelengths limits your range. I'm using a PRO-51 scanner with a mobile antenna (hey, it DOES help, and it's a lot better than the stupid wick that comes included!). Any help would be tremendously appreciated. Send e-mail. I also have lots of freqs for the Fox Valley area if anybody is interested.

> printed weather information to listeners in the Toronto
> Weatherradio broadcast area.

This service is also available here in Winnipeg. Environment Canada came
out to one of the fleamarkets last year and displayed the WeatherCopy
radio/printer. WeatherCopy is just a printout of the information you hear
in voice. I think they were looking at also enabling the reception of
weather maps and other weather related info.

>The data burst consists of several tones of rapidly increasing pitch,
>followed by several bursts of quasi-white-noise. I would assume that
>the opening tones allow some sort of modem to identify, and hence to

Quite correct. I think the tones are DTMF tones to open the reciever of
the WeatherCopy radio.

5773. PRO-51 Squelch mod..

Newsgroup: rec.radio.scanner
Date: 1994-11-21 20:42:03 UTC
From: moy@xp.psych.nyu.edu
Message-ID: <9411212047.AA28762@xp.psych.nyu.edu>
Source record: 265374

Hi everyone,

I originally posted the squelch modification for the PRO-51. I'm glad
the modification works with other sets!

My radio does buzz *very* faintly while scanning. However, this
seemed the same volume after the modification as before. It may just
be easy to hear since the set can scan at 100Hz.

I don't think the squelch level should change significantly with this
modification. My radio seems to open squelch at the same setting.

Do make sure the added resistor really is around 100K. I wonder if
you really have a 103K resistor--or is it just *marked* "103," which
would make it a *10K* resistor! A value that is too low *might* upset
squelch threshold--I have to check the schematic.

Sorry about the pagers. If you're desperate, you might try listening
to the image of the *desired* signal. The PRO-51 is susceptible to
images, but I'm keeping mine anyway. Of course, there are the "other"
mods previously posted on r.a.s. I think they were hardware fixes
that involved power cords and such :^)

Moy Wong (moy@xp.psych.nyu.edu) Dept. of Psychology, New York University

: WALLY@ukcc.uky.edu (Walter R Francis) wrote,

]I just performed the Squelch mod, I put a 103K resister as prescribed
]in the modification file, and it seems to work great... As soon as
]they stop transmitting it starts scanning, maybe a teeny little
]bit of noise..
]
]It seems to go "bzt....bzt" sometimes when scanning, but this may
]just be where it's unsquelching and then returning to scanning..
]
]And is it my imagination, or do you have to turn Squelch way up
]after this mod? Is it possible that this just increases the
]Squelch power? I used to keep the squelch pointed at the "h" in
]Squelch, but now it's pointed above the headphone jack symbol..
]
]Seems to make listening more pleasant.. Now if there were a way
]to not have to listen to all the damn pager systems in town..
]I guess that would require triple conversion.. I'm happy with
]my PRO-51, so I'm keeping it.. (Besides, I guess it's nice to
]not return modified electronics, eh? :)

In my opinion, the AR1000XLT from AOR is the hands down winner in the cellular area. It can search the band in the correct step size, can lock out the control frequencies, and you can switch between mobil and base frequencies by pressing one number key.

As a general scanner, it is difficult to program and not the best choice. For a single purpose cellular scanner, it can't be beat. Best of all, there are still pre anticellular versions available that require no modification.

How long have the FCC ruled to "lock out" cellular frequencies?
I understand some units can be modified and they proceed to get tougher
to modify? But when did they decide to delete the cellular freq band?

I was talking with a Radio Shack man and he was quite evasive, like he
thought I was the "Scanner Man" there to lock him up if he mentioned the
word 'modification' or what frequency cellular phones operate.

He mentioned "bleed over". I owned a PRO-37 about 8 months ago and picked up
some cellular calls. Is that what I received, "bleed over", or was the FCC
rule just been put into affect?

: work? I'm about 20 miles from the lake.

: Lastly, RadioWare lists a high vhf antenna that can be cut for the
: specific freqs. any experience with this type and is it directional?

I bought a Radio Shack ground plane (20-014, $29.99), and shortened the tallest vertical radial by 2" for perfect resonance in the center of the VHF marine band. I'm a avid boater, and live about 10 miles from the lake. I have one of my older VHF radio's at home so the wife can call me to see how I'm doing. I also have used is to listen to what's happening in regards to fishing.

For recieve only this antenna will probably work fine, I used an SWR meter to get it right when transmitting.

I wouldn't use the fiberglass whip, unless that's all you have room for. A simple ground plane will typically outperform the figerglass whip.

I wouldn't recommend a directional antenna, because the angle of reception is quite small. I have designed and built antennas for many years. Using a parobolic reflector and a simple dipole you could make what's known as a corner reflector antenna. It will have more gain than a standard dipole, or ground plane plus directivity can be much wider than a standard beam, known as a yagi. Also will have a better front to back ratio if you want to eliminate some interference from behind than a yagi.

Hi there...
Just to add another data point, I have the same howling problem that
you describe in my PRO-37 while listening to 800Mhz freqs...

- Alvin

> When I used to own the '34, I remember having a problem in the 800 Mhz
>region. When the volume was turned up, I would get a howl during the
>transmission. Somehow, the sound was feeding back into the oscillation
>circuits to create the howl. After taking apart, I tapped around on the
>radio and found exactly what you described, a microphonic sound in one of
>the coils. Slipped a piece of foam on it and solved the problem.

It is? I wouldn't bet on it. It would certainly stir up a bunch of
interesting debate, in congress and elsewhere.

I was asked so I am passing the question on. With the new breed of superfast
ie. 100cps, scanners has anyone noticed that they tend to skip over week
signals that they recieve when on slower scan rates?

Well, umm, that's one of the things the interface is great for. I only entered about 50 channels by hand (to fool with the unit before I hooked up the interface). I mass enter stuff in my Mac now, and send it to the 8000. Also allows me to keep a full backup of the whole 8000. I just use a term program and a couple of very simple scripts. One day I will find time to write a program, but I have not been terribly motivated since I can just use Smartcom to do what I currently need. I still have to find the time to create a US band plan for the UK version I have, and dump it into the 8000. This will make the AUTO functions suggest the correct mode and step most of the time, instead of the wrong ones.

You can reprogram the whole scanner (ie full clone) in about 5 or 10 minutes (as I recall).

For Sale:

2 year old Uniden BC100xlt Scanner-

100 channels, 10 banks
well taken care of
detachable, rechargeable nicad battery with charger
leather carrying case
ear phone included

Features-

channel delay
priority channel
weather channels
lighted display
Key pad lock
search and hold functions for looking for new frequencies

If you are interested you can e-mail me direct at jbb@christa.unh.edu. I
am asking $100 firm (shipping included)

Jamie.

5799. RS PRO Scanners

Newsgroup: rec.radio.scanner
Date: 1994-11-22 14:05:45 UTC
From: nlepoide@uk.oracle.com
Message-ID: <9411221405.AA27116@ukpyr2.uk.oracle.com>
Source record: 265408

I have been reading this newsgroup for a while now and I am having trouble knowing what the various scanners are !!

Can someone post either here or to my email address, a list of the RS PRO Scanners Past & Present. Stating which scanner succeeded which and if it is a desktop or handheld model. Also what are the frequencies for each scanner ??

A lot to ask for I know but any help will be gratefully received.

Nigel Le Poidevin

R82 is a 15 ohm, it needs to be 1 Watt metal oxide, R83, from memory (I'm at home) is a 10ohm. I have never seen any problems with this one but R82 has been known to go now and again.

Hope that helps

5802. Modem to Scanner - help!

Newsgroup: rec.radio.scanner
Date: 1994-11-22 15:02:33 UTC
From: starin@netcom.com
Message-ID: <starinCzoCGA.1Ew@netcom.com>
Source record: 265412

Before I go ahead and blow up my modem through experimentation, I thought I'd ask the gurus in this group if they know how to connect a radio tape out plug to the input of a modem. Any ideas?

thanks

> Sh> reversing the conventional red=hot arrangement). At one time the yellow

Wouldn't worry about reversing the polarity since most newer consumer equipment is not polarity sensitive. The color codes change depending on the cable used but the RJ11/RJ14 uses red/green and yellow/black. The colors aren't exactly reversed from the "conventional" if you consider that red is normally refered to a the "ring" lead (-48V) and the green, called "tip" is the ground reference (not to be confused with the "earth ground" on your AC outlet). The yellow and black would be used for a second line on a two line phone (RJ14) - black is "tip" and yellow is "ring".

Most if not all 900 cordless phones are spread spectrum. You could monitor
with the right rcvr and correct algorithm. About as easy as monitoring MDTs :)

5807. Re: Activity in 72-76 Mhz Range

>Andy

The paging activity in this band is the remote site links for area wide paging systems on VHF, UHF, and 900Mhz. They are not "bootleg". If you have 2 scanners, you can figure out which link is for what carrier by comparing the two. Also in this band are remote controlled model airplanes. Depending on where you are located, you may also hear remote links for a county or state police VHF,UHF voice system (pretty rare these days).

:)

5808. Re: Do police use DIGITAL TRANSMISSIONS?

Newsgroup: rec.radio.scanner

In a previous article, matthew@hal9000.apana.org.au (Matthew Volkmer) says:

>
>Can anyone tell me if their local police department use digital
>transmissions at all? (Cannot be understood on scanner!)
>
>I am just wondering if digital is used much throughout the world.

Yes and No!

The local police here at the moment do not, but they will be switching to
800 Mhz trunked, digital radios within 18-24 months when they all merge
into a regional police force.

10-4

In article <3argmr$q2e@lucy.infi.net>
roebuck@infi.net (S. Timothy Roebuck) writes:

>
>How long have the FCC ruled to "lock out" cellular frequencies?

They passed it almost two years ago, I believe models in production in '95
are to be unmodifiable to recieve cellular frequencies.. That is,
not easily modified, such as swapping a diode or such..

>I understand some units can be modified and they proceed to get tougher
>to modify? But when did they decide to delete the cellular freq band?

They 'should' be impossible to modify, and the CPU supposidly has the
band locked out by programming so there isn't a way to receive cellular,
but I'll bet there will be few that it will be difficult to modify.

>
>I was talking with a Radio Shack man and he was quite evasive, like he
>thought I was the "Scanner Man" there to lock him up if he mentioned the
>word 'modification' or what frequency cellular phones operate.

He probably was just confused, cellular IS a pretty big word...

>He mentioned "bleed over". I owned a PRO-37 about 8 months ago and picked up
>some cellular calls. Is that what I received, "bleed over", or was the FCC
>rule just been put into affect?

I think he meant images from the cellular band.. My PRO-51 picks up
cellular perfectly on the upper image.. Such as I could tune to 896,
and actually be listening to 874.4000, which is a cellular band frequency.

Note, these are just examples..

Look for mods for your scanner.. I'll bet there are some.. But what is
the point? "Honey, I'm at the corner of x and y, I'll be home in about
five seconds..... I'm pulling into the garage...." or "Yo, you got
some smack (sp?) for my pos'"?

I'm more interested in mods to make the scanner more usable or enjoyable,
such as killing the keyboard beep or removing the squelch tail..

5810. Scanning System

Newsgroup: rec.radio.scanner
Date: 1994-11-22 19:20:55 UTC
From: chris@ll.mit.edu
Message-ID: <1994Nov22.192055.8635@ll.mit.edu>
Source record: 265179

I posted this before, but I don't think it made it. If it did, please forgive me for the repost.

Does anyone know anything about the Seeker 500E Wideband Receiver and Remote Control Scanning System? It's put out by a company call System and Software International (SASI). I saw an ad for this in the back of a friends Monitor America book. The only thing I could get out of it was that it was a scanning system through a laptop computer. Can anyone give me more information about it? I tried to get in touch with the company to get more info, but I couldn't get through. I would really like to know how it works.

Thanks in advance,
Chris

BTW, to all of you that had given me advice on finding the Tac 5 frequency for Wilmington PD:

We are still trying, but we believe that it is one of the input channels. As soon as we are sure, I will post. I don't want to be giving out any bad info.

Thanks to all of you, too!

> what about the cordless gitaurs and microphones?
>

I use to work at a venue here in Charlotte NC we used 155.295,154.600
151.775 for our security. Each band would have their own radios that
they use generally in the 154-155MHz range some in the 460's. They
are low power radios so if you want to hear them you need to be real
close. As for the wireless mikes try 169.445, 169.505, 170.245, 170.305
171.105, 171.845, 171.905. The wireless mike have a range of about
1000 feet at best. Good luck!

Chris Zimmerman-

5812. Mobile scanner/antenna recommendation needed

Newsgroup: rec.radio.scanner
Date: 1994-11-22 19:45:41 UTC
From: amullick@vaxc.stevens-tech.edu
Message-ID: <1994Nov22.144541.1@vaxc.stevens-tech.edu>
Source record: 265422

I'm in the process of helping a friend of mine buy a birthday
gift for her husband, another friend of mine. Both myself and
the birthday-boy are members of our local volunteer first aid
squad and our paging system is terrible so most of us have to
depend on our scanners to hear a call.

We're looking to get a mobile scanner, and though no price range
has been decided, we're not looking for anything extravagent...
just something that works well. Our dispatch frequency is in the
33 MHz area and while there are a few other low frequency channels
of interest, most of our listening is done on 150 and 460-470 MHz
traffic. It would be nice if 800 MHz was available though.

I'm looking for recommendations on both scanners and antenna, given
the above and the fact that this is all going into a Saturn sedan.

It would be nice to have as unobtrusive installation as possible
though as (a) we're in a relatively high car theft area and (b) she's
not too fond of scanners and blue lights and the such.

Any feelings of the car radio + scanner antenna coupler so he only
needs one antenna? Anything else I should think about before telling
her what to buy?

Apu.....amullick@vaxc.stevens-tech.edu

One thing I hate about the Pro2035 is the illogical orientation of some of the buttons. They're off to the far right of the scanner face, so it makes it tough to program in a bunch of freqs fast. I'm much happier programming the Pro2006 on-the-fly.

5819. Re: AOR 8000....can I get one in the US?

Yes, I've noticed that the BC2500XLT skips over some weak ones on 800MHz when it's in Turbo mode, vs the Pro43 which searches at 50cps. The 2500XLT stops on the weak ones when going 20cps though.

-Jeff, CIS HamNet

5821. Re: Help! 800-Mhz Police Band

It's not really the drive-thru frequencies most people are looking
for. If the drive thru is rigged with cordless headsets (i.e.
McDonalds), then there is usually an internal intercom included on the
headsets. With this intercom channel, employees can talk to one another
throughout the restaurant.

Listening to these frequencies during later hours when the restaurant
is not busy can sometimes prove to be quite interesting. :->

I also have an OptoScan456. One of the wires that you hook on (or solder as I did) needs to be routed as far away from a certain capacitor as possible. The assembly manual (at least the version I got) warned you about this problem. I even added some additional wire so I could route it _very_ far away and everything works fine now.

If you can't find the info in your manual, e-mail me and I will tell you the exact wire and cap to avoid.

>Searching between 72 - 74 Mhz netted some local voice pagers...

In addition to paging and radio links, the 72 - 76 MHz range
is used in factories and mills for industrial remote control devices,
e.g., large overhead cranes.

Caterpiller Tractor, John Deere, and the steel plants around the Midwest
are licensed on several frequencies. I sometimes find midband
Motorola HT-220 Handie-Talkies being sold at hamfests here in Illinois.
Some are equipped with unusual control pods with pushbuttons and
switches instead of remote speaker/microphones.

Here's a couple of non-paging confirmations for you:

This was the info given to me. I'm sure there is a unit brand name at least
'close' to what is listed.

Discourage, maybe. But stop us? All you have to do is monitor the FORV channels and when they switch, switch with them. Of course this is with using a cellular phone in test mode which can decode it, but with a scanner, you'd probably need software and a computer.

: : >
: : If there's an A in your serial number, you're out of luck--it's not modifiable.

: Just what was changed after they added the A? Did they just hack off
: the D3-D4 section of the board or was there significant rewiring? If
: you had a PRO-43 with an A in the serial, could you put a diode in
: across one of the leads somewhere (it probably wouldn't be as secure or
: good as if done with an older model, but if you are just trying to "force"
: the scanner to pick up cellular, lets say) or would you have to build
: a whole new circuit board? (and if you're building the board, how big
: would this board have to be - what stuff would need to be on it?)

It's my understanding that what the FCC was shooting for is to have the units changed so that they could not be "readily modified." Now whether that means they just move the diode to the other side of the board or make new chips that are simply incapable of tuning cellular, I don't know. I do know that the FCC would prefer the latter. :-/

It wouldn't be that hard to make an IC that due to it's internal programming, is quite unable to tune cell calls, period. It's not however the most desireable option even from the manufacturer's standpoint. You know the reason that previous scanners have been so easy to modify? It's not necessarily done to make _you_ happy here in the US. It's done so that by simply placing or omitting a 10 cent diode or resistor on the PC board, they can sell the same basic scanner overseas where they have a different frequency plan. i.e. - our cell frequencies here are either not cell freqs there or are otherwise completely legal to receive. The country in question may have other freqs that would be "optioned out" for legal or other reasons by some of those other diodes on the board. For instance, I understand that in Europe, they use some part of 900mhz for cordless fones and that it is illegal to receive them. Dunno if they strongarmed the scanner makers into removing the band though...

dshalita@rogue.com (David Shalita) asked:
> Does Radio Shack have a Service Center where I can get info,
> schematics, manuals, etc for there OLD products?

Manuals and replacement parts for all Tandy products can be ordered from:

Tandy National Parts
900 E. Northside Dr.
Fort Worth TX 76102
(800) 442-2425
(817) 870-5600

Give them the catalog nbr of the device and ask for the Service Manual. If it's an old product they may supply a photo-copy. National Parts provides great service and is probably the best run division in Tandy (how's that for damning with faint praise <g>).

Is there anyone out there that would know how to modify a Bearcat 560 so that the intermediate frequency bandwidth is between 35 to 50kHz?

I would also be greatful for any other information on systems (like Vanguard) for receiving APT satellite images. I am trying to put together a system for our school and am facing budget restraints as well as those that think I'm nuts, so any help would be welcome.

Thanks,
Ross

>a channel number. Obviously the human ear is incapable
>of detecting the minute differences between "Zzzt" and
>"Zzzzzzzt", but perhaps the right voice recognition
[snip]

While I think sound cards have huge potential for solving this problem, I don't think your idea will work.
I have a feeling that the voice recognition software is not going to be able to decode such minor variations in sound. I think the variaiation of swapping a few bits here and there will slip right by the recognition software.
Another problem is that there is a constant stream of data so voice recognition software would not know where one word ended and the next began.
Also, because the nature of trunking it is not sufficient just to decode the "go to ch.x" information. You need to know which group or groups of users the control channel is directing.

A simple method might be to actually try to recognize the voice of the person whose conversation you are trying to follow. But the downside is that usually when the repeater drops, a the second person is the one responding, so looking for the person who was talking before the repeater dropped won't do you much good.

The real use of sound cards is to utilize the DSP features to actually decode the digital data provided the sampling rate is high enough.

Does any one know there are shareware to program MR8100 scanner? If there is such a software, name and place where I can download from it please. My disk with SCAN.EXE had a bad sector in it. I might get ScanStar Pro which will also program the 8100 and use it with my OptoScan456 also, but that cost $80.00 plus shipping.
If you have a SCAN.EXE and willing to e-mail me a .uue version, I think that might works too.

Please e-mail, thanks in advance

If you are using a regular PC modem I don't think you will have much success.
As far as I know the modulation methods used for radio transmissions are
different from those used over telephone lines. You can however purchase
a device which understands the various radio modulation schemes used.
There are a number of these sold by companies such as MFJ and others.

>What is the cost? I heard $500.

Don't trust ACE for any AOR related information. They have a poor reputation and no longer are authorized to sell AOR scanners. EDCO is now the primary company.

In theory, the AR8000 is now available in the USA. From what I heard, no one has them in stock yet. It already has FCC approval. Call EEB for reliable info. The price will be a little over $600, last I heard. Grove also plans to sell them (Grove's price: $649.95)

I've heard some digital transmissions recently on 155.325 MHz, but don't recognize the sound of the modems (i.e., they're not Bell 202 "packet" modems but they fit in a 15 KHz channel). Anyone know anything about how to decode?

The portable PRO-62 is made by GRE and the sample I have
is more immune to intermod than my PRO-43, especially in
the 160-162 MHz railroad range.

Although both use up conversion and are triple conversion, the
IF frequencies are different in the PRO-62 and PRO-43.
The band edges are slightly different, too.

I'm just finishing up a review of the PRO-62.

EDCO (EEB) and Lentini are selling FCC-certified models.

ACE Communications lost the right to sell AOR last year, so you will NEVER
be able to buy one from them!

I have a Pro-43, and I can pick up Cellular calls WITHOUT
MODIFICATION! I just scan at 21.6 Mhz (I think it is: 2 X 10.8 IF)
above the Cellular band, and catch the image. It's not as reliable, of
course, as there is presumably some image rejection, but the times I've
tried this, I guess I was close enough to a repeater to hear several
calls in progress.

There must not be MUCH image rejection, as the manual even spends some
time talking about how to determine whether you're hearing an image.

Maybe the newer models have better image rejection than my (presumably
older) model, though.

Oh, and I was not trying to listen to cellular calls, honest! I wanted
to see what was going on in the 902 Mhz Amateur band.

Dear Bryan,

i&#65533;ve some questions to your article.
What is a no-code--license ?
What is a HT? Does it mean ham-transceiver?
If it is, the better choice would be a scanner, because no
transceiver will give you that frquency range, i think.
Here in Germany the cheapest tiny hand held tranceivers like
Icom,Kennwood a.s.o.are able to work in send/receive mode on 145MHz
and only receive on 430MHz. That&#65533;s not the best of performance i
think. Even very expensive tri-band-models are not able to cover
the range like a regular scanner. (f.e. Bearcat 2500, Commtel B110)
Please excuse my worth english, but it&#65533;ll become better with
continious practice. (i hope ;-))

Best regards

Carsten Litke Dortmund/Germany/Eurpoe

)that corrosion doesn't develop on the wiring.
)
) Jerry
)

Interesting, especially if true. The green wire is connected to ground.
The red wire is connected to -48V. So the red wire is reducing. Any acid
reactions would be inhibited on the red wire.

So that might explain the positive ground. But it does -not- explain why
red is negative.

Another reason why I prefer to distinguish between old and new by serial
number alone. No A = old. The new ones have an A in the serial number &
an A at the *end* of the FCC id.

5883. Surete du Quebec

Newsgroup: rec.radio.scanner
Date: 1994-11-24 05:53:15 UTC
From: vincent@etu.gel.ulaval.ca
Message-ID: <3b19od$sq7@goudron.gel.ulaval.ca>
Source record: 265003

The provincial police of Quebec is suposed to change the
communication system before april 95. Does anyone know which kind of system
that they will or might use... It's suposed to be private and efficient for
a wide area...(almost all the Quebec)

5884. PRO-51 military freqs?

Newsgroup: rec.radio.scanner
Date: 1994-11-24 06:40:56 UTC
From: 16320@ef.ev.maricopa.edu
Message-ID: <199411240646.XAA06281@ev.maricopa.edu>
Source record: 264988

Howdy... can someone tell me if it's possible to restore the military frequencies in the PRO-51? My brother's got one (I have a pro-43), and we were toying with the 51's test mode, but that test mode refused to pick up certain military ranges, even though it let us access the "illegal" cellular freqs. Is there a diode for this range (like the cellular) that can be clipped?

Thanx!

I have a request...(for what it worth)...if people are going to post frequencies could they PLEASE include the important information? like this...

Use: Tx: Rx: Tone:

Rohnert Park DPS CH-1 156.0150 154.1000 103.5
Rohnert Park DPS CH-2 -NARCS 154.9200 154.9200 103.5

To me the Transmitting Freq. is important, the tone is VERY important as well. I compile freq listings throught out California, Nevada and Oregon soon to include Arizona, when I monitor with my 37' ant. I pick up more than one department and need to know which department I am lesting to.

>
>
> Julian

I don't have the original article on my server yet <sigh> but no
it covers what it says. Things to consider though.......no AM/NFM
switching which can be a problem on certain frequencies in the UK
depending if you want to listen to them. Also no capability to overide the
channel spacing. For example 152.3375 is an AM signal used by
West Yorkshire Police, this part of the spectrum uses 12.5KHz
spacing. On a PRO-39 it defaults to FM receiption
and also 5 KHz channel spacing so the nearest you can get is
152.335 in FM - not ideal if 152.3375/AM is what your after.

The channel spacing "problem" is the same on all Tandy handhelds
at the moment. The PRO-43 is the only one that will allow
switchable AM/FM, 152.3375 on the PRO-43 is not so bad - you can
still only get 152.335 but at least you can have it in AM mode.

The above isn't a major gripe but just something to be wary about
and not something the average Tandy Salesperson will be aware
of - if its not a problem for what your wanting from the radio (and
alternatives to ocercome it are more expensive) then the PRO-xxx series
offer a good start to scanning.

From: mc@shore.net
Message-ID: <3b2a43$3k3@shore.shore.net>
Source record: 265005
Cross-posted to: rec.radio.swap,rec.radio.scanner,alt.radio.scanner

FOR SALE: UHF - Public Safety band receiving converter:

Converts 460 - 464 MHz and 480 - 484 MHz Public Safety Band to 144 - 148 MHz which works with a scanning amateur radio 2 meter handie-talkie, mobile or base radio to allow you to listen to the UHF bands. Does not convert on transmit. Designed for use on a 2 meter HT, it has a BNC connector on the bottom that attaches to the HT and another BNC on the top that attaches to the antenna. A three-position switch switches the unit off and selects which band will be converted. Coverage will be expanded on units that scan above and below the 2 meter band. The unit is made by M Squared Electronics and is not to be confused with a cheaper unit that is similar made by a well-known manufacturer of cheap ham and swl accessories. I just installed a brand new battery (AAA). Will sell for $30.00 plus UPS.

If interested please reply by e-mail.

Uh, I think you'd better check what radio you're using. The PRO-43 is
triple conversion, with IFs of 608.005-611.2 MHz, 48.5 MHz & 455 kHz, and
is relatively immune to imaging.

> ... the manual even spends some time talking about how to determine
> whether you're hearing an image.

Neither the Owner's nor Service manuals even mention images.

> I wanted to see what was going on in the 902 Mhz Amateur band.

Could it be you were listening to 900 MHz cordless phones?

>How is it they have the "tiger" radios that look exactly like AOR's?

They do not sell "tiger" radios.

They do sell radios with the Trident brand name, many of which come from
the same factory (Nissei Electronics of Japan) as certain AOR models.
There are also similar radios with the brand names Camnis, Fairmate, etc.
etc.

The AR8000 is not manufactured Nissei, so ACE might not be able to get an
"equivalent" product ... or if they do it would be through unofficial
channels that would carry risks above and beyond the usual risk of doing
business with ACE Communications.

[Article crossposted from alt.radio.scanner]
[Author was Jeffrey Starin]
[Posted on Thu, 24 Nov 1994 16:24:31 GMT]

There have been several inquiries in the this group about how to link a pc to a scanner. It can be done, rather easily, through a product sold by Commtronics Engineering out of San Diego. You have to construct the interface unit yourself. It is called the CE-232 interface and total cost is about $180, or something like that. From what I've heard, it is better than the Optoelecronics Interface, which is easier to hook up, but apparently has lots of bugs. I have a CE-232 and I am quiet pleased with it. It's power to awesome, once you understand the scripting feature, which allows you to write scripts that control the function of the scanner based on certain events. There are also a lot of other features, like tapping into IC registers, which you can use for all sorts of things. The documentation that comes with the CE-232 is piss poor, with multiple references scattered throughout, and it is difficult to read. You have to have some understanding of electronics to put it all together. Support is only available through e-mail to the author and developer of this device, Bill Cheek, and although he is helpful, he is probably swamped with many questions about the operation of this thing all the time (much because of his own poor documentation fo the device) so don't expect the kind of support you would get from something as equally powerful, but from a more reputable company. Overall, once you figure it all out, it is a nice piece of equipment, and well worth the the price. It is also fun to put together. For more information, contact the developer, Bill Cheek, at:

Commtronics Engineering
PO Box 262478
San Diego, Ca. 92196

His BBS is:
617.578.9247

And don't forget to say Jeffrey Starin told you to call!

> --
> Larry Spence (lfs@netcom.com)

Hey Larry. Well, first of all, do you live in a metro city? A city which uses digital signals instead of analog? Do you have carriers which also allow people to use something called RadioMail? First of all, around channels 300-310 and 330-345 (forgot the conversion to MHZ) are paging channels. That is what a cellular phone "listens" to for a call. That's how phreakers steal other people's "phone numbers." These ranges are probably what you are refering too.

The FORV signals are broadcasted on the (I believe) channel to the cellular phone on the voice band. If you've ever used a analog cellular phone and hear a brief 1/20 sec pause, that's it! You won't hear it while talking, but if you monitor it with a scanner or a cellular phone in test mode, you will hear a faint BLEEP! That FORV signal does one of many things. Tells the cellular phone that the call has ended. Power adjustment in output (0.6-3.0 watts if applicable). And channel changes, telling the cellular phone to switch to another channel.

Hope this helps! And if you have any more questions, I'd be happy to answer them!

- Daniel Kao

CW> Hi,

CW> I am actually rookie. I just want to know what's the difference between a
CW> scanner and a ham radio. Are they actually the same thing?

BIG DIFFERANCE!!!!!!!!!! Okay, a scanner goes thru a set of preprogrammed
freq. and listens for transmissions, when it stops, it recieves the
transmission and puts it over the speaker for you to hear, a Ham radio
transeves, that means you can recieve AND transmit. It only works on US
authorized Ham bands, though, and you need a license to operate it.
Can you make a phone call? It depends on which license you have. It is possible
to do it, but you need a phone patch, go to radio shack and ask about one.
Go to the library and check out a book on Ham radio to see what kind of
a license you need to make phone calls with a ham radio. You might also
go to the Alt.Radio.Ham and ask in there.

Les -

Your statement that the news media always reports things before we can "back it up" is overbroad and, in my quarter century experience as a reporter inaccurate.

People in all professions make errors, of course. But in the course of gathering and disseminating news, circumstances change.

For example, an airliner crashes killing 100 people plus. But the cause is not known. Should the news media not report the crash or run interviews with experts and witnesses until the NTSB investigation is completed a year later (using the government findings as definition of "back it up")?

The original posting on this thread was from a scanner buff who says he knew what was going on from listening to his scanner before the news media. Let me tell you why his statement is true.

Reporters in Washington DC police headquarters at the time of the shooting were isolated and NOT told what was going on.

Often times we hear things on the scanner in the newsroom but demand "official confirmation" before we air it. This results in delays and, in many cases, inaccurate release of information by officials. We know the information released is wrong, of course, because we heard things unfold on the scanner. But we can't just scalp things off the police radio and broadcast it.

Scanners are, however, an excellent tool used by every news room in the nation. And the poster is right. Many times folks sitting at home in front of their police scanners know what is happening before the news media, or at least before the news media get it confirmed from official dome.

Dave, you don't want to buy a double conversion receiver like the Sportcat or BC220 because you'll end up with images of Amateur radio transmissions. I suggest you check out a triple conversion receiver, like the new RS Pro62. Price from Marymac is around $260 delivered.

5917. Re: Handheld?

The Pro43 is really good, but only modifiable for the missing parts of 800MHz if its datecode isn't after 1A4. Or, you can check the FCC ID number on the back of the scanner. If it ends in 20-308A, then it isn't modifiable.

5918. Re: PRO-51 military freqs?

And scanners can simply be a lot of fun! Probably somewhere around
10 years ago, I was monitoring one of WWJ's 450/455MHz Newsdesk/reporter
frequencies, & heard Gary ask the news desk to give him a call at a
payphone #. Being the mischievious little kid that I was at the time, I
called the # right away, Gary answered, & spent several minutes giving me
some news story he apparently didn't want to give out over their
frequency (in addition to public safety freqs, media also monitors their
competition's 2-way freqs...). I just interjected an "uh-huh" now &
then, & maybe if I was being especially creative, I asked him to slow
down (I was supposed to be copying down this story, I guess...), & maybe
spell out some names, etc.

Finally, after a few minutes of him rambling on about the happening,
he said "So, who is there in the newsroom with you?" I paused & then
said something like "Ummm, Dave & Joe." He asked who Dave & Joe were,
then he finally must have realized that he didn't recognize my voice, &
so, being the great investigative reporter that he is, he said "Who are
YOU?"

I started to laugh, & hung up.

About 30 seconds later, the WWJ News desk guy called him back on the
2-way radio, & advised that he'd been trying to call the # Gary gave out,
but that it had been busy.

A rather dejected (& humiliated?) sounding Gary Baumgarten got back
on the radio & said something like "(sigh) I know, try calling again."

I still get a good laugh at that, each time I here him on 950kHz (WWJ)!

>Gary Baumgarten >ad225@detroit.freenet.org

Tim

P.S. It can be very 'enlightening' for citizens to monitor the media's commercial frequencies (mostly in the 450-451 & 455-456MHz range, although they're using celleular phones a lot more often these days), just as the media often vociferously (& often unilaterally) talks about their 1st Amendment rights, & the right to be able to 'inform the people,' etc. One of the things I quickly learned is that often, the 'on the scene' reporters get much (sometimes most) of their information which they then broadcast "LIVE, FROM THE SCENE!" directly from their own newsroom, which passes it to the 'one the scene' reporter via the 2-way radio links...

Message-ID: <3b3fce$29q@detroit.freenet.org>
Source record: 265032

Ah! So YOU'RE the one I've been searching for all these years!
Just kidding!!!!

Actually, it is rare that my newsroom has much information to
pass along to me on the scene because usually they send me
to a breaking story.

A good exception to that is when, for example, patients
have been transported to hospitals. I (or another reporter)
am on the scene getting interviews and the newsroom is kind
enough to call the hospital for conditions to help flush
out the story. It's not like they do all the reporter's
work for him or her.

By the way, the reason so many newsrooms have switched
to cellular is for competitive reasons. They just don't
want the other station to know what they know.

In our case it's less problematic than with the TV
stations because, being an all news station, we're
gonna put it on the air as immediately as possible.
With the TVs, they need to hold it (usually) til
the next newscast and would rather not give the
competition the chance to get the story at their
expense.

Also, cellular phones tend to be more reliable than
two-ways, especially at longer ranges. But, yes,
sometimes we ARE interesting to listen to,
ESPECIALLY when the discussion isn't really
necessary to the news gathering effort!!!!

>Mike.... I have the OptoScan 456, couldn't locate any reference to
>avoiding a certain capacitor. I do get a little noise, but normally it
>isn't too bad. Maybe rerouting one of the two clip-on lines will help.
>Which capacitor do I stay away from? Thanks .....Daryll

Mike.. thanks for the follow up and advice. That was exactly my problem.
I moved the AUDIO clip lead wire away from C220 and the noise went away.
Just to make sure that was the problem, I move the wire near the cap
intentionally, and the noise level shoots up noticeably.

Daryll.. The capacitor you want to stay away from is C220, which is next
to CN5. CN5 is the 3 pin connector next to back up BATT wires. The wire
which should be staying away from the C220 is the AUDIO clip lead wire from
OS456 board. On my unit the AUDIO wire is white color.

By the way, just to make sure these clip lead would not pop out when I
have to move them, I use a dap of hot melt glue to secure them down. If
you don't have hot melt glue gun, rubber silicone would do also.

Gary, you're right every one makes mistakes, it's just that the news medias mistakes are in the lime light because of the nature of the business. Not broadcasting the information heard on the scanner is wise and of course if you did you'd be breaking the law. Yes, my statement was broad and not intended to cover everyone in the media, just a general statement. I see I should have been more specific, such as mentioning the news reporter during the OJ so called chase on the freeway. While the many choppers were broadcasting the chase one reporter repeated what he heard over the Cell phone. Not too bright considering it's against federal law. Or maybe the night channel 4 here in Detroit broadcast the story about the police officers who got shot in Waterford. The anchor person said the would not release the name of the officer because the Police Department asked them not to yet, he said they would comply, the next scene had a reporter outside of the hospital and he said we are outside of officers xxxxxx hospital. Opps... Well anyway the mistakes are big because every one is watching or listening on the radio, in reality it's a mistake usually not a big deal except thousands of people are watching which compounds it.

>
It will probably be similar to the Ontario Provincial Police.

They use 50 allocated frequencies for use within the whole province,
along with PL tones. Repeater towers throughout the province lets one
O.P.P. detachment/officer communicate with any other detachment/officer in
the province.

It is also possible they could use encryption for privacy.

Cross-posted to: rec.radio.scanner,misc.legal

Is there any hope of ever getting rid of laws against listening to certain portions of the radio spectrum? Has anyone been charged with a violation of the ECPA no-listening-to-cellular clause? Has it ever gone to court? What is the possibility of repealing a law that only a miniscule percentage of the population knows or cares about but concerns a big-money industry (cellular) greatly? It would seem that scanner hobbyists are being restricted by laws written up by by big business instead of the legislature and since we have no voice in the former, we're getting stomped on. I for one think it's wrong for the gov't to be used by big business to correct their own mistakes (i.e., designing an easily interceptable cellular phone system and then lobbying the gov't to outlaw cell scanning). Scanner manufacturers are complying with the new laws, thus forcing scanner users to comply with the law (as old equipment slowly disappears). How does the law ever come to be challenged and what's the little guy to do? Thoughts?

I too just purchased a BC700a and am interested in any mods. Also, can someone tell me why my channel lockout doesnt work on the aircraft band? The darned Jamestown, N.Y. VOR keeps stopping the scan and I have to hit the aircraft band button for scanning to continue. Is my new unit defective?

Thanks for any info you can provide. Please post your response either to this newsgroup or directly to me at rminich@sbu.edu.

Marty Focazio (martyf@panix.com) wrote:
: Jeffrey Starin (starin@netcom.com) wrote:
: : Before I go ahead and blow up my modem through experimentation, I thought
: : I'd ask the gurus in this group if they know how to connect a radio tape
: : out plug to the input of a modem. Any ideas?

: Uh, what are you planning to do here? The input of a modem is digital
: data, not audio. Unless you mean one of the newer voice/fax capable
: modems, and that's just a mike level input. Tell me more...

I got this info off of someone else on this Newsgroup (thanks, BTW)
but, yes, you can get the info from a jack to the modem. RadioHobby
BBS has a file called WB9AGH that gives some assistance. Write me
if you don't know the number. Basically what I did was to take
an old microphone I had lying around and used it (you can use an
old pair of headphones - I was using all of mine, but the mic
was just collecting dust) Cut the wire and inside there was one
small wire with white insulation and there was a few threads of
copper that was next to this wire but inside the main insulation
of the mic wire. Stripped the wire back some so I had access to
these two wires. They are what you want. Then take a phone cord
(drop by the local phone company office and check the dumpster if you
want.. there is usually some with the jacks lying in there) and
cut it. Take the red and green wire and strip them. Wrap one of
the wires from the mic. cord to the red and the other to the green.
Plug into your modem and scanner. I found that when I typed ATH1
I could hear the scanner noise using the modem's speaker. That
file from the Radiohobby BBS gives some sample Init strings to
try that supposedly make the modem read any data you get with
the scanner. I tried both of them (one for 2400 or slower and
one for 9600 - I have a 14.4) with no success. The modem speaker
was evidence that my set-up was working, though. I'll have to
experiment some more. If anyone has any ideas, I'd appreciate
them. If anyone wants some more help or is confused by something
I said in here, write me - I'll try my best to help.

Les:

I remember that incident on Ch 4. It was the talk of the
street reporters the next day, for sure!

It apparently ws the result of lack of communication
between the two reporters via someone inside the station.
The reporter at the hospital was apparently unaware of
the police department's request.

It reminds me of the girl who was beheaded and her body
chopped up into little pieces, then buried in the backyard
in garbage bags in Warren, Michigan by avowed satanists.
Everyone had the victim's name. And her family here had
been informed. BUT, her father (who was divorsed from
her mother) was traveling from Florida to Detroit and
had not been informed.

Once one media outlet published or broadcast the name,
the others felt compelled to as well. I argued against
broadcasting the name but was overruled. However, I
still refused to use her name in my reports. The
station, though, did broadcast it.

It turns out the father heard the name while driving on
the Ohio Turnpike. Well, I covered the trial and got
to know the father pretty well, but never had the
nerve to ask him which radio station he had been
listening to.

After the guilty verdicts were in, I finally asked
the father. What a relief to learn he heard it on
another station! Still, it was a lesson learned for
the boss who ordered her name aired, and he's told
that story on himself many times since!

: of the ECPA no-listening-to-cellular clause? Has it ever gone to court?

None of the laws have stopped me from listening, real nice entertainment,
both cellular and cordless. So far, I have yet to speak/write/read/hear
from *anyone* who has ceased listening due to so-called laws. They are
not worth the ink they were signed with. They do *nothing*. Remember me
and this message next time that cellular dealer says "100% privacy guaranteed
since it's now against the law to purchase/listen to cellular" or that twit
in that place with the cordless phones saying "it's against the law to listen
you a competely protected!". Like I said, never stopped me! As per getting
equipment, that's easy. We have Javiation in the UK and Atlantic Ham Radio
Limited in Canada. Both are only too pleased to deliver to the US! Atlantic
guarantees delivery or you don't pay, simple as that -- they put that IN
WRITING, see any recent issue of Monitoring Times for details.

: -Jeff, CIS HamNet

Since the U.S. Customs would not permit entry of an illegal device. Also since Javiation (UK) and Atlantic (Canada) have *no* difficulty importing them into the U.S., the term US-legal is a little incorrect. Let's be a little more honest here Jeff... The US-CENSORED, or US-LIMITED, or the US-RESTRICTED scanners would be a better means to describe it. We would not want to cause Atlantic or Javiation harm in their business (especially at Christmas!) due to a few slanderous remarks suggesting their scanners are either not legal, can not be legally obtained, or they can not supply legal units to the US. In small quantities up to three, there is no FCC approval required, therefore, there is NOTHING illegal with bringing in such units. Until someone makes a kit with the interface for the AR8000, the cable, AND cellular restore software available, I have yet to meet one person who would given even a thought of buying a US version of that product.

DON'T BUY THE US REJECTS! THEY ARE CRAP! THEY HAVE HOLES IN THEIR RECEIVE SPECTRUM. LET THE DEALERS KEEP'EM! LEAVE'M ON THE SHELF! IMPORT THEM FROM OVERSEAS. PUT YOUR MONEY WHERE IT COUNTS, IN THE CANADIAN/EUROPEAN ECONOMY!

5948. Police Tactical Frequencies - Encrypted?

Newsgroup: rec.radio.scanner
Date: 1994-11-25 14:15:55 UTC
From: gascan@delphi.com
Message-ID: <9411250915591.The_Win-D.gascan@delphi.com>
Source record: 265055

Usually it means that they are simply changing frequencies. It is common for the agencies to save one or more channels for "tactical" situations. This allows units in different areas and perhaps different jurisdictions to use one particular channel for raids, swat situations, or general bs. They (at least in Cal.) do not generally switch to scrambling. They will use cellular phones.

I'm afraid this is a real FAQ, in fact a VFAQ, and I couldn't find an FAQ list anywhere. I'm a complete beginner who would like to buy a general-purpose handheld scanner, just to see what's out there. If I can, I'd like to save my pennies (< 200 UKP?), but I'm aware that you get what you pay for.

I've picked up a copy of Short Wave Magazine which reviews the new(??) Netpro PRO-44. I've also been to Tandy (big mistake?). What I can't seem to get is an unbiased opinion on whether I'd be wasting my time on a NETPRO-44, or whether it's OKish. Do I have to just go and buy one to find out, or should I face facts that I have to spend more than 200 quid to get something half decent (MVT 7000/7100?)?

Any advice or pointers to information I may have missed would be very gratefully received, including decent magazines, books etc in the UK.

Hi,
You are correct. DES is secure. So secure it would take a normal PC years to crack it. If they change the code often you'd have to crack it everytime. No one has cracked it yet. I'm sure there are claims but to my knowledge no one has actually done it. Parallel about 100 dual chip Pentiums together and you would have a decent chance. The Govt keys have more bits than the commercial version so there you have even less of a chance. Bottom line is: for the normal scannist forget it. Unless you have a lot of money$$ If you did manage to break it I'm sure the feds would be giving you a visit to see how you are:-)

It may just mean they are going to a predetermined tactical channel - where a team talks to each other and a field command post but not the dispatcher. When they say "go secure" and then you hear "nothing" - what you thing is "nothing" or "static" may very well be spread-apectrom, encrypted comm.

In theroy, it is, unfortuantly, with such a warping of law over the
last twenty-five years, the court can do whatever the hell it wants.
The way government is supposed to work in a republic (the US is NOT a
Democracy), is that the States have authority over themseleves, and the
federal government is supposed to control only things that have to do with
ALL states. Any rights that aren't given to the Federal Gov't, and are not
denied to the states by the consitituion, are given to the people,
i.e. the states. The federal gov't is not supposed to have the amount of
control it has. The Checks and Balances system stopped working a long
time ago.

Well, my department went to 800 MHz a couple of months ago, and we're all
setup for digital communication, although it isn't rolling as of yet, and
I hope it doesn't, because I consider it very annoying.

>I would like to reorganize my programmed frequencies but the
>200XLT will not allow duplicate frequencies to be enterd.

Yes it will. If you are in MANUAL mode, at the memory channel you
want programmed, use the keypad to enter the frequency, then
press ENTER.

The 200xlt (and other newer Uniden/Bearcat models) quickly searches
memory to see if the same frequency has already been
stored into another memory channel. If it has, the scanner will flash
the channel number.

At that point, you have 2 choices:

1) press ENTER (again) to store the frequency
-or-
2) abort the programming operation by pressing MANUAL.

5971. Christmas Freqs?

Newsgroup: rec.radio.scanner
Date: 1994-11-26 02:55:21 UTC
From: shawn4sk1@aol.com
Message-ID: <3b682p$fmt@newsbf01.news.aol.com>
Source record: 265082

Everybody's going "What?! Christmas Freqs?!" but that's what I'm really going to ask about.

This will be my first Christmas season with a real scanner (PRO-38 to PRO-2006!) and I was wondering as I drove by the Mall today and saw the billions and billions of people stupid enough to even think about shopping today, are there any special frequency ranges to listen to where the "secret shopper" plain clothes security people discuss catching people they're busting for stealing?

Sounded like a fun seasonal idea if there is such a thing going on. (I'm in Springfield, MO if that matters to ya)

I already thought of Mall security but I always listen to them anyway...

:-)

You CAN enter freqs twice. When you enter the channel and it blinks CH 42
just hit enter again and it will do it. It works on mine.
PS you wouldn't happen to know a mod that will get rid of the 15 sec auto
light turn off. I like to have it on continuous sometimes.

Hmmm... far be it from me to run to the aid of one who gives scant info and expects a comprehensive reply, but Jeffrey isn't necessarily too far out of the ballpark! come on, Marty, give the guy a break - look at the back of your modem. I'd guess you'll see a 25-way D-connector for FDX digital (DCE-DTE i/face) and some method of connecting to the outside world via a telephone line (analogue input). This is what I reckon Jeffrey wants to feed his tape-out into. Right... having said that, I don't know enough about US telco singal levels to answer the original posting, but I've done it here in UK. Hey... has anyone wondered why you'd want to do this thing anyway?... Ssshhh, Jeff... keep them guessing!

Are we still having fun?

Have you ever seen a modification for the 200xlt that would allow
full-time AC use? I'd like to keep mine hooked up to the wall plug (like
a desk-top unit) without worrying about messing up the nicads and without
constantly swapping battery packs.

I'm thinking about a current limiter to mount between the wall box and
the scanner. Maybe a box with a switch (Charge/Maintain) that would let
you recharge the nicads and then switch to a minimal current that would
just keep the batteries at full charge.

A more elaborate version would have a "smart" regulator that would
replace the manual switch.

Ideas?? Comments??

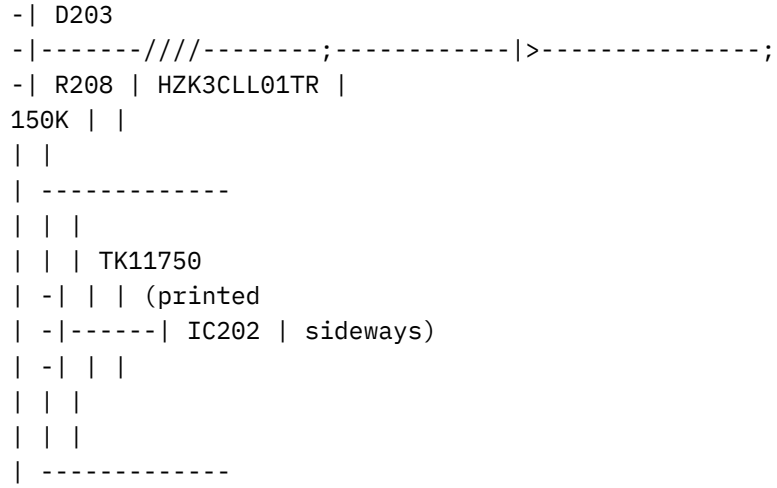
listed)
BC200XLT$198.95

JD>Have you ever seen a modification for the 200xltthat would allow

BC200XLT SHORT BATTERY LIFE SOLVED
BC200XLT

It turns out that the batteries were not really at fault; a
zener diode which determines the voltage at which the low-
battery indicator would come on was defective in some units,
causing the circuit to actuate prematurely. Replacing that
idode and changing the value of an associated resistor pro-
vides the answer.

As shown in the accompanying diagram, zener diode D203 and
resistor R208 are the parts in question. D203 should be
about 7 volts and R208 should be 150,000 ohms. These are
miniature surface-mount devices on double- sided circuit
board; if your radio is under warranty, attemping this fix
yourself will void that warranty.



|
|
|

SHORT CUT
****THIS IS THE ONE TO USE****

Mark Machcinski of Wyandotte, Michigan, came up with hisw
own solution. He simply soldered a wire bridge across diode
D203, disabling the low battery indicator entirely. The
radio now operates uninterrupted until it blanks out when
the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge
the original diode with a 6.8K resistor, defeating the
premature recharge signal, yet preventing the battery from
too low a discharge.

JD>a desk-top unit) without worrying about messing up the nicads and
without JD>constantly swapping battery packs.
J.D. I have a BC200XLT Ihad it pluged into the wall all the time
for the last 5 years, the batteries are still fine, did the Batt.
Mod. still get 9Hr. when I use it on Batteries.

Uniden BC200/205 Business Band Restoration

Prior to performing this modification take the following precautions to insure that damage does not occur to any component inside of your Uniden scanner.

A) Try to perform the modification in a low static electricity environment.

B) Avoid wearing wool clothing or walking across a carpet (in low humidity areas) as well as touching your scanner or any component inside the chassis.

Required tools: A small phillips screwdriver and a fine-pointed snipping tool.

MODIFICATION PROCEDURE ---

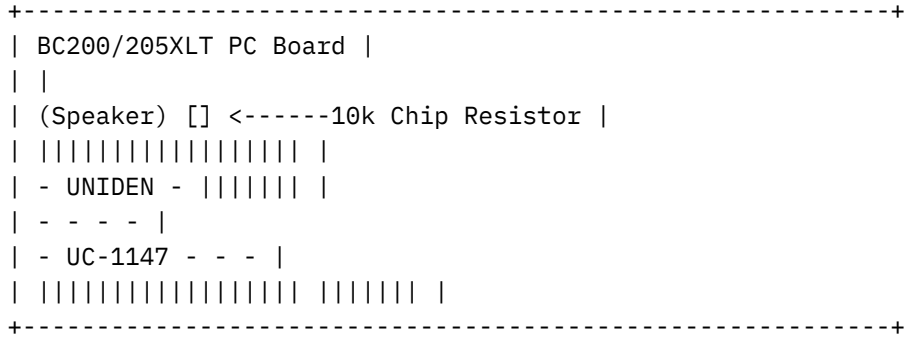
1) Disconnect the antenna and slide off the battery pack from the scanner.

2) Remove the two screws from the back of the scanner plus the two screws that hold the battery pack retaining spring in place as well as the spring itself.

3) Carefully pry the bottom of the rear of the cover from the radio then remove the cover.

4) Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the BASE (the two halves are connected by a plug so their will be some resistance) and separate them.

5) Consult the illustration below and locate the IC labeled "UNIDEN UC-1147" and the 10K chip resistor positioned above the letters "DEN" on the integrated circuit. (The resistor will be color coded brown-black-orange).



6) Using the small wire cutters, cut the resistor in half. (Be careful as the resistor may shatter causing debris to scatter along the PC board). Be sure to remove all left over residue by blowing or brushing it away. The solder pad that the resistor was soldered to may peel up as you remove the resistor. You may peel the pad off if done carefully not to disturb the surrounding area or components.

7) To reassemble insert the top of the front panel into the slot under the volume/squelch control panel while noticing the alignment of the dual in-line connector at the bottom of the board with the mating socket and finally pressing it (the front panel) in place. Be sure that the holes in the PC board line up with the holes in the plastic standoffs under the board.

8) Insert the two screws and gently tighten. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel. Press the cover into place, insert and tighten the screws. Replace the battery retaining sprint with the slotted side facing the notched hole. Insert the two remaining screws and gently tighten them. Slide the battery pack into place and switch the scanner on to make sure the display comes on. If not, check that the battery is charged and/or the battery retainer spring is properly mounted or dual in-line connector was misaligned during reassembly. Assuming the modification and the reassembly was successful, switch the scanner on, press manual, 845.0, E and within a couple of seconds you should see the frequency 845.000 MHz displayed. The modification is now complete!

Try it it is very easy to do.....

5987. Looking for Mr. Frequency

Newsgroup: rec.radio.scanner
Date: 1994-11-26 18:14:54 UTC
From: fporlowi@prairienet.org
Message-ID: <3b7tuu$h4p@vixen.cso.uiuc.edu>
Source record: 265096

I am looking for the frequency for the security force at the Joliet Junior College in Joliet IL. I have looked in all the normal scanner listings with no luck. They don't use the local police frequencies or the normal college frequency and I have also tried the park district frequency with no luck.

--
Are we having fun yet?

Frank

5988. SALE: 200 channel scanner 30-54/108-136/136-174/380-512/806-960 MHz

Newsgroup: rec.radio.scanner
Date: 1994-11-26 18:23:23 UTC

Radio Shack Realistic PRO-2022 -- 200 Channel Scanning Radio Receiver

30- 54 MHz
108-136 MHz
136-174 MHz
380-512 MHz
806-960 MHz

Purchased about one year ago from Radio Shack -- all original wrapping intact. This unit is in cosmetically and electronically perfect condition -- no dents, dings, or any electronic problems. Performs perfectly to all specifications.

Cellular telephone modification (simple cut of one diode lead -- reversible) performs perfectly -- scanning automatically at appropriate 30 MHz intervals.

Includes all commonly used state and federal government, law enforcement, mobile telephone, itinerant business, campus police & physical plant, ham radio, cellular telephone, and other commonly used frequencies.

This is the best scanner I have owned in many years of scanning. It would be a perfect gift for the casual and/or serious radio scanning enthusiast.

Price: $200 (relatively firm) or best offer --plus-- shipping.

Reason for selling: moving to University College, London, England -- 1995.

Please contact by email if interested to make arrangements for exchange.

I can throw in copies of Los Angeles area civilian, campus and nationwide federal government agency -- including rare military frequency directories.

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a scanner or shortwave radio. Just be aware, having the right frequency may not be enough, in tuning to a certain frequency. The time of day, atmospheric conditions, location, mode you're in (AM, SSB, Narrowband FM, Wideband FM, etc.), and your equipment, are also equally

important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), aeronautical communications (mostly AM),
and some military VHF/UHF (Wideband FM). Most all scanners will pick a
default mode for you, depending on what frequency band you are in. But
many scanners also let you manually switch between modes (AM, FM, etc.)
and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes
are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------- ----------

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*

(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75
Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government,
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry, military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, de-pending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

Well, I suppose tuning off freq might work, but I don't think it'll work as nicely as you'd like. The easiest way to do this, if you wanted for educational purposes, would be to build one of the phone scramblers that Electronics Now (formerly Radio Electronics) has published in the last few years. Then, only use one half of it.

You should be able to stop into and RS and order the service manuals for their equipment. I once ordered a manual for a scanner that was about 10 years old with no problem.

RS generally has two levels of service center, regional and national, but the manuals come from the Consumer Mail (the special order section).

Whenever Clinton comes to New York city...don't forget to monitor the citywide police channels for activity. They are normally scanning rooftops for snipers and coordinating the opening and closing of streets as his motorcade proceeds thru town. Also I monitor the Coast Guard East River channel for any special notice to mariners that they give if the river access is restricted. Good Luck...It's always interesting to hear!!!

5995. Re: Cobb County, GA Fire Dept freq?

I noticed this also. I really like the trunking system now.
Every important function is there and easy to hear, especailly
at night when the bus's and the water dept are not operational.

Now I can follow all the neat stuff at a difficult fire were as
before I could not hear that darn low power fireground unless I was
a few miles from the fire.

This morning I heard not only some drunk that shot himself in the arm
but a vehicle ran of the interstate just ahead of where I was
driving about 5:30am. It is really neat not to only hear the
police dispatch but the ambulances fire/rescue medical examiner etc
all being called out in a three minute period. If you miss one deatail
on one transmission it generaly is repeated or enhanced on another.

I like the trunking system now, except for those darn phone calls!
Some really stupid conversations there and the scanner locks on the ferquency until
they drop the line.

We're looking to expand the selection of booklets in our catalog. If you have something to say... something people want to hear... and would like it published in booklet form (40-60 pages, saddle stiched, with a two-color cover), and the topic is in the area of privacy, surveillance, computer security, technology, hacking, or government...

Email me an outline. There is absolutely no cost to you, and you'd be paid a percentage of each sale. We'd prefer that your original be in plain ascii (emailable).

Questions, comments, submissions... fd@wwa.com

5999. C-5's bringing plutonium to Tenn/any incepts?

Newsgroup: rec.radio.scanner
Date: 1994-11-26 22:45:04 UTC
From: KDAHLQUIST@news.delphi.com
Message-ID: <3b8dpg$l98@news2.delphi.com>
Source record: 265107

I was wondering if any monitors intercepted the C-5 transport planes bringing the high-grade weapons materials from the former Soviet Union. The KNBC Channel 4 news made the operation sound like it was right out of a Clancy novel. (Of course, KNBC has made the most mistakes in its OJ trial coverage also) The footage played during the "news-reading" didn't jibe with the supposed immediate "terrorist" conncections.

Message-ID: <3b8h9i$602@wraith.cs.uow.edu.au>
Source record: 265110

matthew@hal9000.apana.org.au (Matthew Volkmer) writes:

>Can anyone tell me if their local police department use digital
>transmissions at all? (Cannot be understood on scanner!)

>I am just wondering if digital is used much throughout the world.

Although a lot of public saftey organisations are "Digital Capable", they
are waiting for the APCO25 standard to to be ratified.

APCO is the Association of Police Communications Officers. 25 is for project
25. Project 25 is all about defining a standarrd for digital trunked radio.
Once defined this will allow you to use a GE AOCO25 trunked radio on a
Motorola system. (What has the world come to !!!!!!)

The base stations are in place already, as the APCO25 standard has no bearing
on their operation. The base stations simply reclock and retransmitt the data
Once the standard has been defined you will no doubt see a very rapid
changeover to digital communications. This will provide an immediate security
benefit to all users (Although this may only be short lived until the
invention of the digital scanner!).

Once digital is established, it provides very easy access to encryption,
whether it be DES or even PGP style.

Enjoy what you have while you can because it is looking very bleak on
the horizon for scanner enthusiasts.

Rick

Lines: 29

Hi all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional
mobile telephone conversations.

The 2026 has cellular frequencies deleted at the factory, but
restoration is the easiest ever! - clip one marked wire! All
you need is a Philips screwdriver and wire cutters.

1. Turn the scanner upside-down and remove the four side screws
holding the bottom cover in place; pull the cover loose and set
it back about two inches out of the way.

2. Locate the small circuit board at the lower right-hand
corner and find jumper L201. Cut it and slightly separate the
break.

3. Reassemble the radio which now has continuous 806-956 MHz
coverage and 30KHz search increments in the cellular band.

*** I have not tried the above mod, but did acquire it from a
commercial radio dealer who is very respectable, so as always,
proceed at your own risk and realize that this will violate
your warranty!

Actually, you can get the RF out of the plane. They did it in the first SAREX (SPACE Shuttle experiment). They used a 2 meter handi talkie and an antenna that was etched on a printed circuit board. The antenna looked like a spiral....I have tried to find info on this antenna but no joy to date.

There are 55 US channels numbered as you wrote.

Some are simplex, others are duplex....therefore there is a gap.
Also, there are some channels for Coast Guard use exclusively. Hope
this
helps.

No intercepts but it did make me laugh. They kept referring to the shipments as "Top Secret shipments from Kazakhstan arrived today" UHHHHH, Wait a minute. If these are "Top Secret" How come everyone knows about them?? "Top Secret" makes the TV news crews think they've reported something really hush hush and they're just so damn smart that they've "uncovered the truth" Next week on Geraldo: Top Secret crewmembers spill their guts.

6009. BEARCAT 210 -- reversed power polarity

Newsgroup: rec.radio.scanner
Date: 1994-11-27 02:06:56 UTC
From: tpenner@abq-ros.com
Message-ID: <05696DOSQQCHHTOIEAE@abq-ros.com>
Source record: 265123

My brother wants me to repair his BEARCAT 210 scanner. He applied +12VDC with the polarity reversed and without any in-line fuse. I checked the power supply and it seems OK...I measure about 18 VCD across the main power supply cap and about 4.1 volts across some CMOS 4011 ICs on the PCBoard. However, I get no display and no indication that the unit is alive.

Has anyone run into this problem with this scanner and perhaps has a ready solution? Alternatively, does anyone have spare parts for this older scanner ... or maybe even a PC board for it (there's only one PC board in this scanner) ?? All replies appreciated.

Hi, I just picked up on this thread. I also noticed the new "trident"
scanners advertized in Popular Comm. My wonder is... how good can the
trident TR4500 be if it can cover 1 to 1300 Mhz for only 469 $ (USD)
when many scanners who cover less usually cost a lot more. Is the TR4500
good quality? is the coverage continuous? And has anyone used it for
radio-astronomy?

From the FAF - Frequently Asked Frequencies file on oak.oakland.edu:

Air to Ground Telephone

Ch Ground Airborne

1 454.950 459.950
2 454.900 459.900
3 454.850 459.850
4 454.800 459.800
5 454.750 459.750
6 454.700 459.700
7 454.725 459.725
8 454.775 459.775
9 454.825 459.825
10 454.875 459.875
11 454.925 459.925
12 454.975 459.975
Signaling 454.675 (459.675)

Transmissions are FM. Ground stations repeat the airborne half
of the converstion, and transmit a continuous tone when idle. From
one to three channels are assigned in a particular area.
Service is used on private aircraft.

---

800 MHz Air to Ground Telephone

- - Airborne - -
Blk Ch 1 - Ch 29

10 894.0055 - 894.1735
9 894.2055 - 894.3735
8 894.4055 - 894.5735 Guard Band -
7 894.6055 - 894.7735 .x765-.x797
6 894.8055 - 894.9735
5 895.0055 - 895.1735 Control Channels -
4 895.2055 - 895.3735 .x813-.x973
3 895.4055 - 895.5735
2 895.6055 - 895.7735
1 895.8055 - 895.9735

Transmissions are AM. Channels are spaced 6 kHz apart. A
specific block of 29 channels is assigned to each geographical
area. Ground frequencies are 45 MHz lower and do not echo the
airborne half of the conversation.

Service is used on passenger airlines.

Bill,

As I recently discovered you are not allowed to poke fun in this group. Folks who spend most of their energy worrying about what private conversations they might no longer be able to listen to don't have time for such nonsense. It is far more important to hone ones 'guardhouse lawyer' skills while profiteering during the ensuing panic. It's really too bad Freud didn't live to see these newsgroups. Flame if you like but thinking is also allowed.

The 100XLT does not have the RF circuitry necessary to TUNE 800 MHz.

>What are my options?

Buy another scanner, or buy a GRE downconverter like the ones Grove is
selling.

Poking fun is one thing, but your post didnt look humorous to me. I saw
no "grin" or ":)" or anything or even any phrase that was remotely
funny. I just saw a person so bored he had to flame a guy for
misspelling a word, instead of simply correcting him.

Hi all.

I will be going on a cruise with Carnival at the end of December. The ship's name that I will be on is "Sensation" I was wondering if anyone knew of any frequencies that Carnival uses on their ships? A list or an ftp/gopher/www site where I might find this information would be much appreciated.

Thanks,

Jesse

From that Point on the Priotity Mode is lock on channel One
It will not turn off and you can not Change The Priotity channel.
I stiil works but only on Channel one
everything else works Great.
What did I do Or not do?

-Well, did you know how to do it before the mod? I know it's a stupid question but I got confused w/ my 34 cuz the way to select a priority channel is not very intuitive. Just in case, I'll tell you how to do it. You hit PGM and then the number of the channel you want prioritized (not the frequency) and hit PRI. You'll have to it PRI in scan mode again to activate the mode. Hope this helps. BTW, i've done the mod and mine works fine.

>>x
Pro34 Mods

Remove the four screws from the back of the unit, then remove the batteries. Gently remove the back cover from the unit. You will need to de-solder the antenna from the top board. Then remove the nuts holding the squelch and volume pots. There may be a wire at the other end of the top board to de-solder, which I think is mainly for grounding purposes. Then, there are four hex screws holding the top board on. Remove these and carefully wiggle the top board loose from the bottom. I say wiggle because there is a multi pin connector to unhook. Once unplugged, slide it out horizontally so that the volume and squelch pots slide out with the board. Then there are three screws to remove to lift the metal shielding from the bottom board. Once you have the bottom board in plain view, you should see D9, D10, D11 and D12 on one side of the board. Cut one lead of D11 and seperate the leads so they dont touch. This removes D11 from the circuit and adds the 800 mhz cellular phone bands to your scanner. It is a hassle to get to D11, but the added frequencies are worth it in my opinion. Of course, LISTENING TO CELLULAR PHONE CALLS IS ILLEGAL! There are other mods that do various things to the diodes but these mods are of little value. One, for instance, adds the 66-88 Mhz band but it also removes the 30-54 Mhz band at the same time. In addition, many units won't even pick up anything in the 66-88 band without major realignment. I know mine won't! There is one other mod that's worth doing. I can't remember the part designation, but there is a ceramic 2 Mhz crystal on the logic board (probably blue in color), near the main CPU You can replace it with a 3.4, 3.55 or similar value for increased scanning speed. If you go over 4 Mhz, your CPU *may* not be able to maintain its integrity. If you use a normal crystal, you'll have to bend the leads over and lay the crystal flat over a nearby chip. It will fit though and it works! Make sure the crystal leads and the crystal body are insulated from touching any other circuits. If you use the two second delay, it will be affected by the crystal. The delay time will be reduced by increasing the crystal frequency. When you put the unit back

together, make sure the key lock switch is intact. Mine fell out and I didn't notice it was missing until I had everything back together. Also, don't get the antenna connection too awful hot. There is a surface mount cap near the underside that will fall off if you apply too much heat. This is the input cap from the antenna. You'll notice decreased signal strength after you put it all together again. It can be a real bear trying to put surface mounted parts back on the board!! Trust me ;-)Only remove D11, by desoldering it or clipping one lead. Do not
add a diode to D9.

Yep. I think Mark is hearing CHP on 154.920 courtesy of a scanner with poor selectivity (not uncommon). No way would the CHP be routinely using the CLEMARS frequency.

6053. Using Secure Clear cordless to decrypt inverted signals

Newsgroup: rec.radio.scanner
Date: 1994-11-28 05:32:41 UTC
From: "Gregory yea... you can call me Greg" <gregmason@delphi.com>
Message-ID: <pKyXFXJ.gregmason@delphi.com>
Source record: 265164

It's relatively well known that SSB-capable receievers can be used to decode signals encrypted using inversion technology. If, like me, you're not fortunate enough to own an expensive "super scanner" don't despair. You can beat 'em by joining 'em.

If you already own a Motorola Secure Clear cordless phone, or other cordless utilizing a speech inversion encryption scheme, you're already well on your way to decoding these signals.

You'll need two scaners, or a scanner and a tape recording of the signal you want to decode, and a Secure Clear, or similar, cordless phone:

1. Disconnect your phone at the modular jack. this is so that you won't be bothered by dialtones, etc.

2. Direct the scrambled audio signal into the mouthpiece microphone of the cordless handset. Some experimentation may be nessecary here to determine the best orientation of speaker to microphone.

3. Determine the current transmit frequency of your cordless handset. (49.XX)

4. Tune your scanner to the transmit frequency of your cordless handset.

That's it! You should now be listening to unencrypted audio.

Of course it is illegal to decode and listen to encrypted transmissions which aren't directed to you. It may also be illegal to listen to cordless phone conversations depending upon where you live.

The intent here is to remind everyone that those Secure Clear phones may be clear, but they ain't secure. If your conversation includes sensitive content, use the corded phone.

Source record: 264727
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I am using a threaded BNC connector from my roof antenna to my Pro 43. I cannot pickup distant signals unless I pull the connector and insert the copper wire from the center of the coax cable. As soon as I touch the braded wire to the antenna base (out side) I lose the signal and just get static covering the transmission. I have the braided wire cut back so it will not interfere with the center wire when mounted to the connector. Any suggestions??

Thanks, Neil

I received a Uniden 200XLT as a birthday gift from my brilliant father while I already have a 2500XLT. Yes, I could use both in multitasking-scanning, but I would rather sell it and save my money for the new AOR8000,
It's new, in the box, although I did check to make sure that it does have the desired cellular frequencies ready for your listening pleasure.

This model is likely to appreciate soon, so E-mail me an offer, and I'll contact you (via phone or however you want) with details.

I'm in the NY area, but the Internet nor Scanning has it's geographic boundries.

gregp@dorsai.org

Thanks, Greg

6058. indoor antenna info please?

Newsgroup: rec.radio.scanner

From: lsilver@netaxs.com
Message-ID: <3bbvhm$6jl@netaxs.com>
Source record: 265169

Hi, I am looking for information on buy/building an indoor antenna.
I live in Center City Philadelphia, on the tenth floor of a 19 floor
building.
I am not permitted to have antenna outside my windows.
I am interested in a wide range of frequencies including 800's. If more
than one antenna is needed, that is ok.

BTW, if someone can direct me to an ftp site with info on antenna's in
general or email me something, I'd appreciate it

Thanks, Larry

6061. Frequency inversion scrambling software

Newsgroup: rec.radio.scanner
Date: 1994-11-28 11:18:47 UTC
From: I.Wraith@sheffield.ac.uk
Message-ID: <17DD2ED7A7B@Rivelin.shef.ac.uk>
Source record: 265174

Hello
There has been much talk in this group recently on the subject
of frequency inversion scrambling and the hardware required to
unscramble it. I have just written some software which can both
scramble and unscramble frequency inverted audio that requires only
a PC and a basic sound card.
At the moment the program can't scramble/unscramble audio in real
time instead it works with prerecorded .wav sound files. So if you
record some scrambled audio from your scanner using any sound
editor program then save it with the name scramble.wav. Then type
"inverse scramble.wav" after a while the program will create a
file called out.wav which contains the unscrambled audio which can
be played on any .wav file player.
If a .wav file containing clear speech is put through the program
the out.wav file will contain the same speech but scrambled.
I have uploaded the program to the anonymous FTP site FTP.FUNET.FI
in the directory pub/ham/dsp under the name INVERSE.ZIP. This site
can be very busy so keep trying.
The program is not perfect as the output contains some distortion
but it is an interesting first which you might be interested in.

Please let me know what you think.

Ian

Jim,

Maybe people are interested in the frequencies used to talk back to
the sign. <grin> Many McDonalds use 1 CTCSS tone of 103.5 Hz. A friend
of mine was an installer for a General Electric 2-way shop. He was issued
portables for use at jobsites. The portables operated on 154.600 MHz,
CTCSS of 103.5 Hz. He happened to visit a McDonald's drive-through while
talking to a co-worker on the portable. Needless to say, he was surprised
(and delighted!) to hear his voice emanate from the drive-up loudspeaker!

The condition you describe is indicative of a defect
in the coax, antenna, or at the coax/antenna junction.

Another possibility is that you are trying to use an
antenna at a frequency for which it has very poor performance,
e.g., becomes a dead short at that freq.

The PRO-2035 is manufactured by GRE. I performed a side-by-side
comparison of the PRO-2035 vs. the PRO-2006. The results are
scheduled to appear in Monitoring Times, January 1995 issue.

I'm told most subscribers will receive that issue during the last
week of December.

There have been at least 2 reviews published, one in MT, and
I think the other was in either the American Scannergram
or RCMA Journal. Tom Swisher posted he is evaluating a PRO-2035, too,
and perhaps he will be putting his comments in the National Scanning
Report.

John,

Here are several Bucks County police frequencies to start you off...

501.0375
501.1625
501.1875
501.2375
501.2625
501.2875
501.3125
501.3375
501.3875
501.4125
501.4625
501.5125
501.5625
501.5875
501.6375
501.6625
501.7125
501.7375
501.7625
501.7875
501.8625
501.9875

501.1600
501.2350
501.3100
501.5100
501.7100
501.7350

502.0750
502.1125
502.4250

My boyfriend did not give me identifications for any of these. I think
many of them are patrol cars and a dispatcher or two. Have fun!

Do the following at your own risk!

THIS ERASES ALL FREQUENCIES IN YOUR SCANNER!!!!

1. Turn off scanner.
2. Hold down the 2, 9, and Manual keys.
3. Turn on scanner.

All channels will be zeroed and locked out.

P.S. It will allow dupe freqs to be entered, just press enter again.

It will allow you to enter duplicates; it's just showing you that a duplicate
exists. Press "Enter" a second time and the dup. frequency will be stored.

For future reference, holding "2", "9", and (I think) "Enter" (or is it "Manual")
while turning on the scanner will clear all frequencies (the other one stores
some factory test freqs. in the lower part of memory.

**********REPLY**********

Jeff-

Are you trying to monitor digital radio transmissions with your scanner?

(Hey guys I think he's he's trying to take the tones received from a AFSK transmission from his scanner to the modem and have it display the text.)

You might want to jump over to the Ham radio Digital section on the net. Hams use a digital mode called Packet Radio. It can be monitored using a scanner and a modem (called a TNC). I don't know if you can do it with a regular old modem.

Most ham radio TNC's have software that will allow them to decode and display; Morse code, FAX, WEFAX, Weather Satallite transmissions, Packet Ham Radio, and several other digital modes.

E-Mail for more info.

Greg

A friend of a friend is looking to buy a scanner for her husband for Christmas.

I have a PRO-34 and PRO-43 and have been happy with both units. I recommended the PRO-43 to her (as I doubt she'll find a 34 anymore), but I'm wondering how we know if the 43 she buys can be modified to receive cellular?

Also, she asked about the 2032 and 2305. I'm not familiar with these units - can anyone tell me about them? Are they good units, and can they be modified to receive 800 cellular?

What other radio shack scanners are good? Which ones can be modified for cell?

Thanks!

6078. How to shield a PRO-2006?

From: kjn@netcom.com
Message-ID: <kjnD00BHw.70n@netcom.com>
Source record: 264753

" BS> In article 9tv@crl6.crl.com, mhalver@crl.com (Mark Halverson) writes:
" -->In Sonoma County and in some parts of the state their are using 154.9200
" -->the CLEMARS freq for VHF, this is also their simplex re-broadcast freq.
" -->used to tx from the patrol car to their hand held radios.

Partially yes, partially no.

154,920 is *a* CLEMARS freq. It is designated as "Gold - 1" by the Ca. O.E.S.
license holder for the CLEMARS system. CHP aircraft *do* use this freq when
communicating with SO or other local agencies. The CHP VHF simplex freq
is typically 154.905 with no PL tone activated.

" BS> I have the CHP car extender as 154.905

" Well, I have CLEMARS here as 484.2375
Your list is in error. The above freq is allocated for land mobile
(business band).

" Ok, here are some CHP FREQS FOR YOU
[deleted]

CLEMARS frequencies:
California Law Enforcement Mutual Aid Radio System
Gold - 1 154.920
Gold - 2 154.935
Gold - 3 155.475 also called NALEMARS*
Gold - 4 460.025 (UHF simplex & rptr output)
Gold - 5 465.025 (UHF input where available)

CALCORD 156.075 (public safety coordination)

* NALEMARS = National Law Enforcement Mutual Aid Radio System
Authorized only for Base-to-mobile or mobile-to-mobile communications. No
Base-to-base unless for extreme emergency..

For info... operation on the above freqs. is limited by 47 CFR 90.423 to
operation at or below altitudes of 1.6 km (1 mile) AGL and to an output
power of 10 watts. No PL tones are authorized.

Another interesting requirement is that NO speech scrambling. voice
encryption or other form of voice privacy is allowed on ANY CLEMARS
channel...

Regards;

>Actually, the RF components are inside metal boxes (inside the
>plastic case) and the shielding is quite good. I wonder what sort of
>problems you have had?

I dont know what kind of trouble the original poster has, but I can tell you
about my experience.

I have installed an OS456 board in my 2006. While I am happy with the perfo-
ormance of the board, the proximity of the scanner to the computer results
in significant low frequency interference.

A friend, fortunate enough to have more than one 2006 has reported interfer-
ence from annother radio when stacking the radios one on top of the other.

I have been able to cure most of my computer rfi problems with my 2006 by
installing tin foil on the inside of the top and bottom pannels. Additional
tin foil wrapped around the cables behind my desk, and annother couple of thick
nessed of foil beneath the printer which occupys the shelf directly above my
2006 have virtually ended my rfi problems.

I'm waiting for some genius to come up with an aftermarket shielding kit for
the 2006. Anyone interested in starting up a cottage industry?

Itd be pretty easy to make a die to cut a piece of copper sheet to the dimens-
sions of the areas requiring shielding. Throw in a little double sided tape,
and youre in business!

Dont forget to send me the royalty checks! I expect 10%!

---Greg

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby. It tells where you can buy your first scanner, what features it should have, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves by their sensitive baby monitor intercom. Yes, it's legal to listen, and it's all there in the 46 and 49 MHz ranges.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Listen to airline pilots as they talk with air traffic controllers and their companies between 108 and 137 Mhz.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that California, Florida, Indiana, Kentucky, Michigan, Minnesota, Nebraska, New Jersey, New York, North Dakota, Oklahoma, South Dakota, Tennessee, and Vermont have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack, Uniden (Bearcat and Regency brands), and Cobra offer a wide choice of scanners. Personally, I don't recommend AOR brand scanners.

Scanners are available in two varieties: crystal controlled and programmable. The crystal controlled models are cheaper, but require the user purchase and install a $5 crystal for each frequency of interest. Programmable (synthesized) units don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a

mobile scanner which connects to your auto's electrical system.

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2004 and PRO-2005 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-34 portables.

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas can extend reliable reception to 100 miles or more.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best deals on new scanners are from reputable mail order firms like Grove Enterprises (Brasstown, NC), Scanner World (Albany, NY), or National Tower Company (Shawnee Mission, KS). Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI), also sell scanners. See the shortwave "welcome" article for the addresses of other scanner suppliers.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as

taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for about $7.

I also recommend Richard Prelinger's 1985 book, Monitor America, published by SMB Publishing, and available from Grove Enterprises for about $15. Although somewhat out of date, this single edition contains 582 pages of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterpises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications. The best frequency lists are often found in club publications, discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the

NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to

exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Three models, the ICOM R7000, Bearcat 250, and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-75 or CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $18.50 per year, which includes a monthly newsletter of about 95

pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $15 and more information is available from All Ohio Scanner Club, 50 Villa Road, Springfield, OH 45503.

> If you're not in the US, can you even buy these radios?

You will find most RS scanners available in the UK & Europe.
Curently the PRO-39, 44, 43, 46 & 50 are in the handheld range.
The PRO-23 & 51 never made it to the UK that I am aware of.

Base station wise the 2006 is still around together with the
2032 and the new 2035 is now avialable.

Some of the GRE manufactures radios are also available under the
"COMMTEL" brand name, these are made for Altai.

The COM-202 is the PRO-44, COM-203 = PRO-39, COM-204 = PRO-43 &
COM-205 = PRO2006...always makes me smile when those people who
have an aversion to "Realistic" branded products are more than
happy to consider the Commtel range..:-)

I have been using Scanner Buff data base for keeping track of frequencies.
It s a good program (ver 3.80.4) except the numerical listing . It isn't
quite 100% in numerical order. I have lost track of the author Bob Ricci, so
it is not possible to have this problem corrected. He was susposed to have a
better version out but I have never seen it. My question, query, poser etc.
Does anyone know of a later version of Scanner Buf, it's author or a better
program that will do everything SB will. Except for that one glaring problem
it is a very good program. Please answer by post or email at cjs9@cornell.edu

You must mean the Renewal "reuseable" alkalines from Rayovac.

Yes, and you must buy the batteries and charger together - a generic
charger, or the charging circuit within a handheld scanner will explode
them.

They give you near-alkaline performance for many cycles (the less you
abuse them before recharge, the better they will perform).

6105. Alinco 580, or alternative..

Newsgroup: rec.radio.scanner
Date: 1994-11-29 14:22:14 UTC
From: WALLY@ukcc.uky.edu
Message-ID: <1707D83C6S86.WALLY@ukcc.uky.edu>
Source record: 264766
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I am looking for a ham radio to get me started into Amateur, and a friend has suggested the Alinco 580 several times due to its ability to receive a wide array of frequencies (even heard it can do 1khz to 1300 mhz?) and maybe even transmit there, but I don't see a reason for that..

Does Alinco (or anyone else) make a radio that can do these things, but is only two metre? I really don't need the dual band, unless there is a lot of action on 70cm.. The ~$380 price tag is a bit too much for me..

Thanks for your suggestions..

Alvin Wang mentions 'strange howling noises' coming from his Pro-37
while listening to the 800MHz frequencies...

Aha, didn't you know this was a secret 'revenge circuit' designed by the
cellular companies to ruin scanners eavesdropping on their precious
airwaves?

Seriously, tho', I had the same exact problem with my Pro-2021. Turn up
the volume, and the 'feedback' would occur. But not always, and not always
on 800MHz. It would happen on the police freq's, as well. I think it
tended to be more amplified on the 800MHz freq's because they came in
much strong. Usually I would be able to get rid of the noise by using
the extremely technical solution of turning the scanner on and off a
few times. This usually worked. Not knowing the solution, I never took
the cover off to figure out what was going on.

>The second question I have is: can I use my HAM radio to make a phone call?

This is flambait, right? :-)

A scanner is a radio capable of picking up the VHF and UHF utility
bands. They used to have 4 or more crystal controlled channels, but now,
with no exceptions I can think of, they are all microprocessor-controlled.

A "HAM" radio is a radio used to talk to other "HAM"s. It may cover any
band from 1.8 to (at farthest extreme!) 300 GHz. Some VHF/UHF units are
equipped with a DTMF pad that allows licensed amateurs the use of
phone-patch-capable repeater stations.

Are you a member of VE3UOW? Waterloo's radio club is quite active ...

Newsgroups: rec.radio.scanner

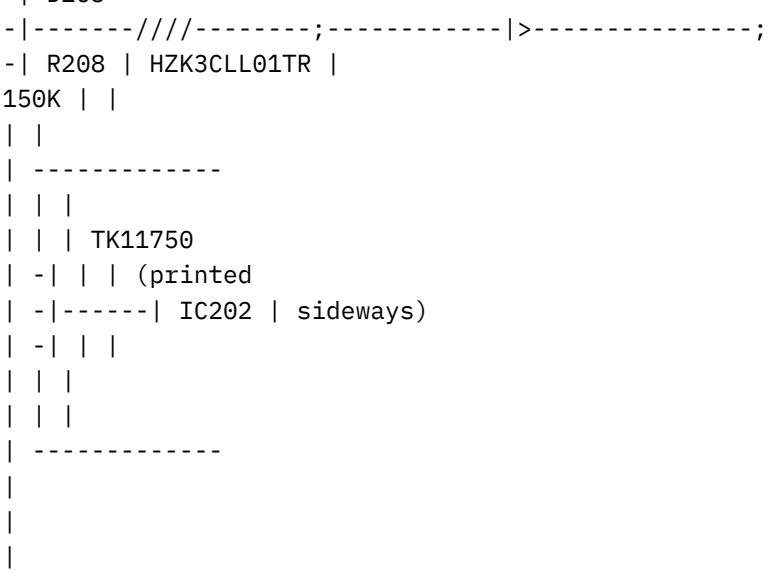
CA>Having watched this group for awhile, I'm wondering if there are any
CA>mods that can be done to the Bearcat 100xlt.

BC100XLT SHORT BATTERY LIFE SOLVED

It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor pro-vides the answer.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.



SHORT CUT
****THIS IS THE ONE TO USE****

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The

radio now operates uninterrupted until it blanks out when
the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge
the original diode with a 6.8K resistor, defeating the
premature recharge signal, yet preventing the battery from
too low a discharge.

I have a < one year old Radio Shack Pro-39 for sale. I am the original owner and have the original box and manual. I haven't made the cell mods to this unit, but it can be done. Actually, if one is so inclined, cell can be heard very clearly on this unit at just under the regular band. Not sure why this is. I find I'm using my 2006 more and would be willing to sell this one.

I paid $299? or so for the unit and will sell it for $200/obo including shipping in the US. It's in perfect cosmetic shape. I use regular AA batteries in the unit now and they last quite a long time. This is a double-speed scan unit with 200 channels (10 banks of 20). It has the original rubber-ducky antenna which works fine in all circumstances for me.

If you drain them near-dead, you will get the MINIMUM number of useful
cycles out of them (25 or less). If they are drained more lightly they may
give acceptable performance (still better than nicads) for up to 100
cycles.

6120. ICOM R1 -WARNING-

Newsgroup: rec.radio.scanner
Date: 1994-11-29 21:00:04 UTC
From: danhsu@unixg.ubc.ca
Message-ID: <3bg4ok$9n9@nnrp.ucs.ubc.ca>
Source record: 264880

There is a problem that makes the R1 nearly useless for scanning purpose. The main problem is that all frequencies above 70 MHz in FM, WFM, and AM(?) the R1 is receiving might not be the actual transmitting frequency. For example, you want to listen to a radio station at 95.3 MHz, you enter 95.3 MHz WFM (which it should be) and hear the station. Now enter 73.9 MHz (21.4 MHz lower), you will notice that it is same station. This happens throughout the frequency range (70MHz->1GHz). The main point is, you might be receiving the correct frequency or 21.4 MHz lower. Is it really the correct frequency? I had this problem with the R1 that I bought. Please confirm if other R1's have this problem.

This is a common problem with almost all scanners. It use to be considered a
"plus" in the old days. Sometimes it was referred to as the "magic number"
for getting frequencies not available through the scanners programming.

The bottom line is, this is the price you pay (along with birdies) for wide
frequency synthesized receive capability.

All but the most expensive radios will have this problem. It is not new, and
it is not unusual. In the case of your example take the frequency, subtract
10.7Mhz to get you RX injection. Since your R1 (scanner) has a wide front end
(to accommodate that wide coverage range) that same injection frequency (84.6
Mhz) will mix with the frequency 73.9Mhz. Two different frequencies were
enter via the keyboard, but the radio uses the same injection frequency for
both.

Welcome to the world of scanners! :)

I don't know much about the R1 but this is a common "problem" with
double conversion scanners. If the R1 is double conversion (someone
else can confirm this) then what you experience is normal and to be
expected.

Seeing an advertisment in "Monitoring Times" for ScannerWEAR for windows. It is supposed to control OS456. Well it costs $100. I called to see if there was a demo. It costs $10 for 10 min's of use. BLAH!
Is Radio Manager the only other program out there? It's good but not quite right for me. Anything with a decent Spectrum analyzer?
Anything for a budget?
Thanks.

)Jeff Briskin
)briskin@binah.cc.brandeis.edu

This is called "microphonics" and is a result of mechanical to
electrical feedback. Somewhere in the unit is something (usually a
capacitor) which changes its electrical value when stressed
mechanically. Adding foam rubber or similar vibration dampening may stop
your problem.

Mike - I also get cellular and some business and public safety in the 851-868 range. I'm not sure if it's real or an image. In any case, 868-894 is supposedly "common carrier" cellular phones. 894-896 I believe is airphone.

In a frequency guide I have for L.A. County, I have listed below the
frequencies that are listed. I really haven't tried most of
these, so maybe you should try programming them all, and see
what you get. I do know, that they all aren't police frequencies,
but some may be for other uses, like for Engineering Service
dispatching a plumber to fix a leak.
Anyway, here's what I got. Sorry, I can't tell from this list,
what each frequency does, and where it broadcasts from. I do
suspect, though, that the VA Hospitals in the area, the police do
use some common frequencies:

Location Frequencies
Bell? 406.325, 409.325
(I know of no VA facilities in Bell, but it's listed as such)

Brentwood 406.325, 409.325, 168.525, 168.575
(168.525 & 168.575 may be some good bets for police frequencies)

Long Beach 155.34, 168.325, 168.525, 168.575
Long Beach 170.400, 171.387, 406.325, 409.325

Los Angeles 164.175, 164.500, 164.700, 168.525
Los Angeles 168.575, 169.300, 171.387, 406.325
Los Angeles 413.825, 417.600, 419.150,

The PRO-62 employs up-conversion, which means the first IF is
very high (257.5 MHz). It is more immune to images than scanners
with a low frequency first IF, so you won't be hearing 440 MHz
ham repeaters in the 460 MHz range or 130 MHz commercial aircraft in
the 150 MHz public safety bands.

The scanning speed has nothing to do with the number of conversion
stages.

Yes. To prevent microphonics, radio manufacturers have been known to
melt wax over critical components -- a practice used in the
synthesizer circuitry in the PRO-2022 scanner as well as old Japanese
AM/FM transistor radios of the 1960s.

Hello Everyone...

I need some help..

I own a bearcat 2500XlT Scanner (handheld unit..)
recently i purchased a mobile home and lost reception....probably all
the metal
my problem is should i get an amplifier or and external antenna?
of course since, this is a mobile home the park has a rule of no
external antennas what can i do.. i have no crawl space (ie attic..)

i have thought of a removale car type phone antenna...

any suggestions... no i am not going to sell my mobile home....

6139. Railroad End of Train Xmitter Data Wanted!

Newsgroup: rec.radio.scanner
Date: 1994-11-30 05:50:20 UTC
From: pfferris@aol.com
Message-ID: <3bh3qs$1cp@newsbf01.news.aol.com>
Source record: 264900

Greetings,

This might be a bit esoteric or inappropriate, but I'll ask anyhow... does anyone here know the frequency and gorry details of the End of Train xmitters? Is it simply a beacon (X.25 packet, or what?), what is/are some common freq(s)? Hint: I'm in Union Pac territory (<sigh!> used to be KATY and MoPac Country... If I ever seriously start to model, I'll remember the KATY I think...!). What type of data is xmitted by these things? Just saying "Yeah I'm still here..." or other data. I imagine these would have to be fairly low power so that the engine CAN'T receive it from 100 miles away! :-) Or am I wrong in presuming their primary purpose is to inform the crew that the "last car" IS still the last car?

Sorry if this has been beaten to death in recent history, just getting a reliable newsfeed again!

Please send any replies to:
pferris%mohawk.uucp@drd.com <Preferred Address!>
or pfferris@aol.com - but prefer the above address first!

I do not have that problem with my SR2 (half 2-meter transceiver, half
25-950Mhz scanner). I did the above test and it passed. I know my sr2
scanner half to be fairly close to the R1. The specs for both receivers
say Triple conversion (266Mhz, 10.7 Mhz, 455Khz).

: I don't know much about the R1 but this is a common "problem" with

>

"Trident" badged radios are manufactured by the same Company who
previsouly sold their equipment to AOR & FAirmate.

Problems with Quality Control and AOR's desire to go elsewhere
for production in Japan and distribution in the USA resulted in
their range of scanners "changing name".

The TR1200 is the same radio that was previsouly sold in the USA
as the AR1000XLT (It is still sold as the AR2000 here in the UK
but is also available as the Camnis 10). Coverage is 500KHz -
1300MHz no gaps (although new ones in the States may have celluar
deleted I'm not sure ?). 1000 channels with AM/NFM/WFM on any
frequency. It has the facaility to lock out specific frequencies
when searcing (birdies, data etc).

The TR2400 (also known as the Camnis 50) is a sort of follow on
to the AR1500 & AR1000 and I assume came about as competition to the
Yupiteru 7100. It was offered to AOR but they turned it down and
went on to produce the AR8000 elsewhere. It has continous coverage with the
additional feature of a BFO for SW. Overall the TR2400 is improvement
over the AR1500 and also has the capabilty to tune in 1kHz steps.
Coverage is 500KHz - 2060MHz with AM/NFM/WFM & SSB on any
frequency. 1000 channels.

Both the 1200 & 2400 have quite complex operating proceedures
although like many things once mastered they are not too bad
however it can be a long winded set of key pushes to get where you want.

If you are not bothered about SW/SSB (I guess not) then I would say leave
the 2400 alone, The TR1200 will give you most things the 2400 will but
without SSB capabilities.

I can't say how they directly compare with the PRO-51 in terms of
performance as I have not had the opportunity to try one however
the '51 is lacking full UHF military airband coverage and FM broadcast
transmissions.

How does the Ar8000 ultra wide band radio fair as to this type of problem?
Particularly how bad are the birdies and how numerous are they?

[snip]

You might also try "spray on" RFI screening. Don't know how well
it would work in your particular instance but spraying the inside
of the plastic case wouldn't do any harm.

That's what is so troublesome with the Icom R1. It's plagued by
terrible selectivity, not merely simple images due to wide
front end filtering. That's a pity because it is otherwise a
neat little radio.

The R1 I borrowed heard the same 155.61 MHz police repeater on at least
a dozen other frequencies in the VHF-high band at the same time.
Same with hospital/ambulance transmissions on 155.34 MHz. One would
think the R1's local oscillators are poorly filtered and rich
in harmonics.

It's been discussed at least a dozen times before on the net, but
you may have missed it.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen in the 46.61 - 49.97 MHz range to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves between 49.67 and 49.99 MHz by their sensitive baby monitor intercom.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA. A new law threatens to outlaw listening to cordless phones, too.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend many of the AOR brand scanners.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and

usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners almost always provide more audio than portables, and portables are usually more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat B760XLT (a/k/a 950XLT) and Radio Shack PRO- | 2006 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a | 205XLT), 220XLT, and Radio Shack PRO-43 portables. A | number of owners report problems with the Icom R1 and the | Uniden/Bearcat 8500XLT and 2500XLT. New Uniden replacement | models, the 9000XLT and 3000XLT, will be available soon.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 | is a good performer.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801, can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be somewhat more prone to lightning strikes because they are not at "DC ground."

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or

enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot | be easily modified to tune the cellular phone bands. |

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, 2nd edition published by SMB Publishing, and available from Grove Enterprises for about $25. This single edition contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions. |

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterprises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license

database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and | contains a handful of fields for every FCC license in the | US. It works well.

Grove enterprises sells FCC license information on CDROM | for $100. The fields are similar to PerCon's Spectrum | CDROM, but the transmitter and licensee location are | intermixed which makes query results confusing. The first | release has problems with mistakes in the data and | documentation, and I look forward to a new release to | correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in | several states, I will locate FCC licensed and selected FAA | transmitter sites in an area of your choice, and produce a | custom color map. I call this new innovation RadioMap(TM) | service. It allows you to identify antenna sites | (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, | RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. Rick Christian advises these strict rules for the AOSCNet Scanner Radio Echo (as of 2/1/94):

1. No discussion of cellular modifications or discussions on how to monitor cellular transmission.
2. No discussions on topics which would violate the ECPA '84, TDDRA '93, (18 USCA 2510 et seq.) or Communications Act 1934 & 1984 as amended (47 USCA 705), i.e., decoding/reception of paging, cellular, encrypted stuff, descrambling etc..
3. No Aliases.
4. No discussion of Shortwave or Amateur Radio material (except SAREX).

For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members sometimes sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $10 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Many CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for the remainder of | 1994 and 1995. All meetings will be held on Saturdays at | locations announced in advance.

December 10, 1994 - Philly's Restaurant, Rt 83 & 63rd St., |
Willowbrook, IL |
February 18, 1995 |
April 15 |
June 17 |
August 19 |
October 14 |
December 16 |

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $10. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp., and available from Grove Enterprises for about $25. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $20. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is the best book in print for this difficult to obtain information.

A more accurate, but smaller and less comprehensive book is Midwest Federal Frequency Directory. It was published in 1986, and copies are getting scarce. Copies may still be available for $10 from Scan America.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 | instead. The fields are similar to PerCon's Spectrum CDROM | (see below), but the transmitter and licensee location are | intermixed which makes query results confusing. The first | release has problems with mistakes in the data and | documentation, and I look forward to a new release to | correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells | for $29 and contains a handful of fields for every FCC | license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts in | several states, I will locate FCC licensed and selected FAA | transmitter sites in an area of your choice, and produce a | custom color map. I call this new innovation RadioMap(TM) | service. It allows you to identify antenna sites | (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood,

near your office, at an airport, and other places of | interest -- from VLF through microwave. |

This is completely different from the limited maps | displayed on the Grove Enterprises CDROM. Through a new | licensing arrangement with a professional mapping company, | RadioMap shows detailed streets, railroads, rivers, and | cities. Ham radio stations are not shown as they would | clutter the RadioMap. RadioMap includes key sheets which list frequencies, callsigns, and licensee names. In rural areas, ranges of up to 10 miles are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom color 8-1/2" by 11" RadioMap reports, | suitable for framing or laminating, for areas in any of the | 50 states. Send $19.95 for each color RadioMap, your name, address, and telephone number, along with center location | (nearest intersection of 2 streets, or latitude & | longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL | 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on

the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the

taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

6151. Re: VA Hospital Police freq's

Newsgroup: rec.radio.scanner
Date: 1994-11-30 13:52:54 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <D032K7.H1u@nntpa.cb.att.com>
Source record: 264907

Most frequencies used by Veterans' Administration hospitals
are allocated for federal use but not by the FCC. It's a
longshot, but you might check the GSA Federal Protective Service
frequencies if you can't find the security guards on VA frequencies.
There's a lot of commonality among federal usage in different areas
of the US, so maybe this listing of VA hospital freqs in Illinois
will help:

30.3700 klm512____us: veterans adm, veterans' hospital
[downey] (govt rcds)

40.4500 klb817____us: veterans adm, veterans' hospital
[hines] (govt rcds)

163.2500 pag call?_____us: veterans adm, veterans' hospital paging
[hines] (others)

164.1750 klb813____us: veterans adm, paging
[chicago] (B Parnass)

164.5000 kai223____us: veterans adm, veterans' hospital
[danville] (govt rcds)

164.7000 klb812____us: veterans adm, security, repeater
[chicago] (others)

166.2000 kai224____us: veterans adm, veterans' hospital security, repeater
[downey] (others)

klm531____us: veterans adm, veterans' hospital
[danville] (govt rcds)

The 4 buttons are:

Top button - Function or shift

Second button - monitor (breaks squelch)

Third button - Light (both keypad and display)

Fourth button - Keypad lock

Thats it!

Source record: 264913

A buddy of mine just gave me an audiovox sp-95 cell phone. It's claimed to be intermittant and does not work properly and thus the reason it was given to me. It will connect to a cell site in which I get a message saying it's not hooked up for operation. I have instructions to program it internally to set it up for operation. Are there any mods for it to make it recieve any cell calls as a plain receiver? I pulled it apart and all the chips in it have over 50 pins. It's not an easy task to work on without a lot of documentation. Any help wou ld be greatly appreciated. thanks. tyler

6155. aor8000 sources?

6156. Restore 0-25MHz on 2006 possible?

Newsgroup: rec.radio.scanner
Date: 1994-11-30 18:30:24 UTC
From: maverick@csulb.edu
Message-ID: <3bigc0$svn@garuda.csulb.edu>
Source record: 264916

I was just wondering if anyone knew if it was possible to restore the 0MHz-25MHz or 0KHz-25MHz frequency range on the RS Pro-2006. I know that the 800 MHz are restorable, but the 520MHz-760MHz (UHF tv) is not.

Thank you for your help. Feel free to reply directly to my email if you'd like.

6157. What's from 2000-3000 MHz?

Newsgroup: rec.radio.scanner

: connector. Any suggestions??

You have a short somewhere in the coax between the shield and the center
conductor. I would guess the short is in the connector at the radio end
of the cable.

Use an ohmmeter to check - with cable disconnected from radio, you should
have a high resistance between center and shield. If it shows a short,
cut off the connector from the radio end and check again.

Do scanner manufacturers give a spec for maximum power re-radiated by the first LO? Anybody know what typical values would be? Does the FCC have a regulation specifying the maximum amount of re-radiation for various classes of radio equipment?

Microwave ovens (i believe) run at about 2.3 to 2.4 Ghz.

The PCS frequencies are there as well (e.g. 2.4-2.5 Ghz)

Most scanners don't go over 1.3 Ghz, with some going to 2.0 Ghz.
Above 2.0 Ghz is really rare.

Any products you guys know about?

Mick

>The scanning speed has nothing to do with the number of conversion
>stages.
>--
I am new at this, obviously, so for one what is "IF"?? So if triple conversion
makes a scanner less sloppy, ie: gets less cellular bleed over, why get it ??
Mainly I want to find out the most I can about the pro-39 and pro-62 within about a week so
since the pro-62 is on sale and i could take the pro-39 back if
i determine that it is better, ie: if it is faster, if the AM/FM helps alot,
if it can also be modified to get more cellular, etc.

thanx in advance!!!

Is there an FAQ for frequencies broken down by area? If not, does
anybody out there have ANY freq's for the following areas of Florida?

```
Indian River County
St. Lucie County
Ft. Pierce
Vero Beach

In the interest of band space, please send to linehan@hps.sso.loral.com

TIA
David
```

6166. HELP! - How to protect oneself from eavesdropping?

Newsgroup: rec.radio.scanner
Date: 1994-11-30 22:07:43 UTC
From: an162081@anon.penet.fi
Message-ID: <221304Z30111994@anon.penet.fi>
Source record: 264925

Hi,

I come from Eastern Europe. Recently I got a message from my parents
that there was an attempt to install eavesdropping equipment in their
apartment while they were abroad.

During communism our mail correspondence was ocasionally checked and
phone calls were taped (which we have proofs for), but there was never
any evidence of eavesdropping equipment (althought we suspected it all
the time).

My parents do not know whether any equipment has been really
installed, but there is very strong evidence for an entry into their
apartment on this very purpose.

I am not a novice to electronics, but I have no experience with
electronic surveilance, because any information of this kind was
highly classified in my country. Therefore I would like to ask several
questions:

1. What is the usual frequency, modulation and power output of
micro-transmitters used for eavesdropping? Are any special features
like going off air during silence, or even remote control, which
could significantly complicate a potential search, commonly used?
2. What is the usual size and appearance of such a thing? What are the
most common places it is placed to?
3. What is the usual methodics of looking for eavesdroping equipment?
Can you provide me with any tips to facilitate a search?
4. What kind of equipment is useful or even necessary to conduct a
search? I know that there is professional equipment for doing this,
but obtanining such equipment is out of question. Therefore I am
considering some kind of a scanner. I am now in the U.S. and
leaving for home in 10 days, so I can buy what is available there,
but I do not have much money to spend on it.

Sorry, I want to stay anonymous, because this group may be read in my
country. Answer here or to an162081@anon.penet.fi

Thank you.

-nn

Denver/Eastern Front Range/North Central CO Expanded Edition 9410

SCANlist 9410 Volume 7 #4 COPYRIGHT 1994 The Metro Comm Center/Phil Mangone. All rights reserved. Updated 10/12/94 for Denver and the Eastern Colorado Front Range.

Distribution of this list is at no charge and courtesy of this BBS from the The Metro Comm Center. Use of this on-line publication for monetary gain or republicationwithout permission of the Author in part or whole is prohibited.

Updates to this list and other frequency lists are available for download from The Enterprise BBS @ 659-8294 for the metro area and 785-0217 for the Greely/Longmont/Ft. Lupton area, The King's Market BBS @ 665-6091 for the Denver Metro area and Longmont, 225-3491 in the Fort Collins/Loveland/ Wellington area and 346-3491 in the Greeley Area. Please send all e-mail correspondence to me through either of the above listed BBS systems.

Use of this information in the commission of a crime is prohibited and prosecutable by Local, State & Federal Laws. I do not assume responsibility for misuse of this information.

Due to the nature of Public Safety Communications frequencies and use are constantly changing therefore I do not assume responsibility for changes, incorrect information and omissions. Use of this list is to enhance one's use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning laws within the state of Colorado. However due to 'home rule' jurisdiction allowed by the state it would be wise to check on local regulation in your area.

I do not encourage anyone to "Chase" calls as you are asking for trouble with law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e. F-1 is the same as channel 1.
###.##### S Indicates non-repeater use. Both base and mobile stations use the same Frequency Commonly referred to as "Simplex"
PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Controletc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems for "Input Scanning"

IFB Interruptable Feed/Fold Back. TV audio feed for reporters.

NOTES FOR OCTOBER:

AURORA 800:

On October 10th Simulcasting of the two dispatch groups and the Services Group on the old UHF radio system were discontinued. The Auora Fire Department will continue to simulcast their dispatch group on 154.400 until completion of their new fire station signalling system.

DOUGLAS COUNTY FIRE:

The changeover for all of the agencies that are dispatched by the county is completed. To our knowledge all Douglas County Fire agencies except Parker and Louviers ares dispatched by the county on 151.115.

DENVER 800:

Same old same old. Intemittent crashes, consoles failing and four letter verbs over the air about system manager failures. Time to string up the equipment manufacturer in my opinion.

TANDY NEWS:

As if it were not commonly known Tandy Corporation [aka Radio Shack] had to pull all their 800 MHz scanners that were manufactured by uniden after the implementation of the TDDRA in April because of a factory test mode that included one of the Cellular frequencies announced the PRO-51 should be back in the stores this month. Tandy also released the PRO-2035 the 1000 channel successor to the PRO-2006. There have been mixed comments about the new scanner and complaints about the setup of 10 banks of 100 channels that lead to a lot of unused memory locations in cases where a bank is dedicated to a trunked radio system which will at the most use only 20 channels. Otherwise use for blocks of frequencies works well. For now anyway rampant word on the street is that Tandy will be trying to get a 400 channel triple conversion portable out by Christmas.

SEASONAL FREQUENCIES:

With the rapid approach of the winter season on us adding the highway maintenance frequencies can be very benificial while traveling or on the way to and from work. The Colorado Department of Transportation frequencies are of value when traveling the interstate highways. Here is a listing of the CDOT frequencies used for the Front Range and Summit County. 151.070, 151.085 for the Metro Area and I-70 Tunnel approaches. 151.265 for El Paso County. And 159.045 for Boulder, Larimer and Weld Counties. These frequencies are allocated statewide so these will be active in other areas of the state. For specific areas look under the area jurisdiction for which you are interested in with frequencies listed as street maintenance or city services.

CREDITS:

Somebody suggested I should do this more often so... Thanks go to
Randy Lynch for being himself. Bill Koppleman for spreading the word
on this and the echo on the Rocky Mountain Monitoring Net on 147.225
Sunday evenings at 8 P.M. Radar Kessler for the encouragement. Jim
at Mountain NewsNet for information pertaining to the reorganized Douglas
County Fire communications system and South Metro Fire communciations
system. Marshall Barry and Bob Whiston for getting the echo mess fixed.
The people who participate in the echo and who corner me in person.
And finally you who are reading this and making it worth the effort!

Does any one Know the cell restoration mods for this scanner

Do Youknow where I can get them

mtomek@ccs.neu.edu

6169. Roosevelt Field Mall Freqs??

Newsgroup: rec.radio.scanner
Date: 1994-11-30 23:36:21 UTC
From: hglassma@daniel.drew.edu
Message-ID: <1994Nov30.233621.113751@daniel>
Source record: 264940

I've checked MONITOR AMERICA, SCANNER MASTER, and BEYOND POLICE CALL and I cannot find the freq for the Roosevelt Field Mall in Nassau County (Long Island). I'm looking for the security freq. Can anyone out there let me know what it is?

Thank you.

PS - Roosevelt Field is the largest mall on the east coast......

6170. Fast Food Freqs

6171. Wireless Mic's. What Freq??

Newsgroup: rec.radio.scanner
Date: 1994-12-01 00:19:11 UTC
From: robhall@bu.edu
Message-ID: <3bj4pv$8af@news.bu.edu>
Source record: 264929

If someone would tell me at what Frequency I could pick up wireless mics,
like the ones they use at Rock Concerts and such. Thanks
Rob

Does anyone know of a scanner that will break down the new law enforcement technique of transmitting on and recieving on multiple frequencies. I believe they are using a General Electric computer driven system of some kind. If anyone can
shed some light on this for me I would appreciate it.

GENIE LAUNCHES CALLSIGN DATABASE

Rockville, MD - November 30, 1994 -- GEnie, the online service from General Electric, has launched an online callsign database, according to Glen Johnson, WB2MPK, manager of GEnie's Radio & Electronics RoundTable . GEnie subscribers can look up QSL information for over 600,000 US hams online . The feature can be accessed by typing RADIO at any prompt on the system. The Radio RT has also forged alliances with CQ Communications, publishers of CQ Magazine, Popular Communications and other radio & electronics publications, and Optoelectronics, a major manufacturer of communications and electronics equipment. Members of GEnie's Radio RoundTable can obtain product support from these and other companies online . Optoelectronics does product support exclusively on GEnie .

"We're committed to remaining as the premier online service for radio amateurs and electronics hobbyists" says Johnson. "We have everything from ham radio to shortwave, an online database of upcoming VE exams that users can search by date or city, and more and more companies serving the ham community are joining us. We even have a feedback area for Newsline!"

GEnie will also have full access to the Internet by the end of the year, giving hams access to literally thousands of programs, files and newsgroups.

For further information, contact Glen Johnson, Manager, GEnie Radio & Electronics RoundTable via email at radio.rt@genie.com .

Well, air traffic control radars, telemetry, long range military radars and things like that. I think PCS is pretty close to 2 GHz but I don't think it exceeds it. It is microwave, you oven is around 2.7 GHz. The "proper" term would be SHF (Super High Frequency). Military (Electronic Warfare) is E band. Standard is S band.

6177. WANTED:NFL FREQS

I understand that starting with this season, the NFL allowed sideline coaches to transmit directly to their quarterbacks who wore helmets with receivers built-in. It sure would be fun to listen-in to those transmissions just like the pit crews & drivers during car races.
Does anyone know what frequencies are being used and what method if any is being used to prevent the opposing team from listening?

Here's something I've posted from before:

Since there has been quite a few posts wanting this data, here is a
list of fast food frequencies that is listed in the November issue of
Monitoring Times. But be aware, the FCC isn't exactly issuing frequencies
to every fast food chain for their own use, and that any fast food
restaurant can buy whatever low powered FM transmitters / receivers
they need for their store at an electronics shop. Anyway, just stick
the below in one of your scanner's channel banks, and see what comes
up. All this talk about food is getting me hungry.

Gourmet Restaurant Frequencies
------------------------------ ----------------------------------

Arby's 30.84 31.00 154.57
457.55 479.25

McDonald's 35.12 67.775 70.245
71.105 154.49 154.58
461.0375 463.2875 466.0375
468.2875 469.5125

Hardee's 30.84 31.00 35.02
151.685 151.805 464.0125
469.0125

Kentucky Fried Chicken 31.00 170.305 457.5375
457.5875

Taco Bell 30.84 154.57 465.8875

Wendy's 33.16 33.40 154.515

Burger King 30.84 457.55 465.8875
467.775

> not.

Negative. The circuitry just isn't there. Some scanners do go down
that far, but in my opinion you're better off buying a separate
shortwave radio. I've heard that many scanners that do scan down
there, can be sort of deaf to shortwave reception. Also, shortwave
really demands a different antenna, mainly something like a very
long wire, to receive the long wavelengths of shortwave.
I do, myself, own a separate shortwave radio next to my desktop
scanner. If I get bored with one, I just use the other.

P.S. The lowest frequencies you usually hear in the U.S., start about
520 khz, at the start of the AM radio dial. Below that (from 150 -
519 khz) is considered longwave. Nothing is broadcasted down there,
except maybe some navigational beacons, although I've heard in Europe,
there may be some audio down there. But check out rec.radio.shortwave
for more info.

Anyway, below is a frequency guide I've had:

THE RADIO SPECTRUM

This is an approximate look, to help in searching frequencies on a
scanner or shortwave radio. Just be aware, having the right frequency
may not be enough, in tuning to a certain frequency. The time of
day, atmospheric conditions, location, mode you're in (AM, SSB,
Narrowband FM, Wideband FM, etc.), and your equipment, are also equally
important. You'll find most transmissions are broadcasted in Narrow-
band FM. Some main exceptions are shortwave (AM & SSB), commercial AM
radio (AM), commercial FM radio (Wideband FM), television (Wideband FM),
citizens band radio (AM & SSB), aeronautical communications (mostly AM),
and some military VHF/UHF (Wideband FM). Most all scanners will pick a
default mode for you, depending on what frequency band you are in. But
many scanners also let you manually switch between modes (AM, FM, etc.)
and frequency search spacing (5 khz, 12.5 khz, etc.) if the default modes
are not correct. Happy Listening!!!

FREQUENCY USES/SERVICES
(in Megahertz unless
otherwise indicated)
---------------------- --

10 - 150 khz Military/government, submarine
(.01 - .15 MHz) communications.

150 - 535 khz Longwave Band, beacons, foreign broadcasts,
(.15 - .535 MHz) maritime.

535 - 1700 khz Your standard AM radio dial.
(.535 - 1.7 MHz)

1.7 - 30 Shortwave/High Frequency Band. Broadcasting,
two-way government, military and commercial
communications, amateur radio, CB radio (approx.
27 MHz), others.
Shortwave - Approx. Range Meter Band
1.8 - 2.0 160*
2.3 - 2.495 120
3.2 - 3.4 90
3.5 - 4.0 80*
3.9 - 4.0 75
4.75 - 5.06 60
5.9 - 6.2 49
7.0 - 7.3 40*
7.1 - 7.35 41
9.4 - 9.9 31
10.1 - 10.15 30*
11.6 - 12.1 25
13.57 - 13.87 22
14.0 - 14.35 20*
15.1 - 15.8 19
18.068 - 18.168 17*
17.48 - 17.9 16
18.9 - 19.02 15
21.0 - 21.45 15*
21.45 - 21.75 13
24.89 - 24.99 12*
25.6 - 26.1 11
28.0 - 29.7 10*
(In general, the lower shortwave frequencies
<higher meter band> are received better during
the night, while higher frequencies are re-
ceived better during the day. There are also
some amateur radio bands between many of these
shortwave bands(*). Consult a shortwave guide
for more detailed information.)

30 - 50 Very High Frequency Band. Government, business,
walkie-talkies. Also, cordless phones and
'baby monitors' found about 46 - 49 MHz.

50 - 54 Amateur radio 6 meter band.

54 - 72 TV Channels 2-4.
Channel 2 Audio (Wideband FM) 59.75

Channel 3 Audio (Wideband FM) 65.75
Channel 4 Audio (Wideband FM) 71.75

72 - 76 Manufacturing, remote control, eavesdropping
bugs, etc.

76 - 88 TV Channels 5-6.
Channel 5 Audio (Wideband FM) 81.75
Channel 6 Audio (Wideband FM) 87.75

88 - 108 Your standard FM radio dial.

108 - 136 Aeronautical communications (AM).

136 - 138 Satellites.

138 - 144 Military communications.

144 - 148 Amateur radio 2 meter band.

148 - 150.8 Military use.

150.8 - 174 Business, highway, law enforcement, government,
weather, maritime.

174 - 216 TV Channels 7-13.
Channel 7 Audio (Wideband FM) 179.75
Channel 8 Audio (Wideband FM) 185.75
Channel 9 Audio (Wideband FM) 191.75
Channel 10 Audio (Wideband FM) 197.75
Channel 11 Audio (Wideband FM) 203.75
Channel 12 Audio (Wideband FM) 209.75
Channel 13 Audio (Wideband FM) 215.75

216 - 220 Maritime and aeronautical.

220 - 222 Land mobile communications.

222 - 225 Amateur radio.

225 - 400 Military aviation and space.

400 - 406 Military and government.

406 - 420 U.S. Government.

420 - 450 Amateur radio.

450 - 470 Ultra High Frequency Band. Business, industry,
military, fire, government.

470 - 512 TV Channels 14-20, shared with law enforcement.

512 - 824 TV Channels 21-69.

824 - 849 Cellular telephones (receivers/handsets).

849 - 851 Aeronautical telephones (ground-based towers).

851 - 866 Business, public safety, trunked systems.

866 - 869 Public safety, law enforcement, trunked systems.

869 - 894 Cellular telephones (towers).
Note: Even though listening to cellular telephone calls is technically illegal in the United States, one will usually do better listening to calls on the tower frequencies, as opposed to the handset frequencies. This is because most cellular phones transmit less than one-watt of output. So unless the cellular phone is very close to you, you will have much more luck scanning the more powerful towers, which transmit/receive for each cell site.

894 - 896 Aeronautical telephones (handsets).
Note: In scanning airplane telephones, you will usually do better listening to the handset frequencies, instead of the tower frequencies, unless you are very near a ground transmitter. But, in any event, call traffic heard on handset frequencies (which are transmitted from a high-powered transmitter on the aircraft) you may hear nothing at all, or many conversations, de-pending on your location and time of day.

896 - 901 Private land mobil units.

902 - 928 Land mobile, amateur radio, personal communi-cation units, cordless telephones.

928 - 932 Radio paging.

935 - 940 Business radio.

941 - 944 Government and non-government fixed services.

944 - 952 Broadcasters' studio-to-transmitter links.

952 - 960 Private fixed services, paging.

960 - 1240 Aeronautical navigation.

1240 - 1300 Amateur radio.

1300 - 1350 Aeronautical navigation.

1350 - 1400 Radio location.

1400 - 1427 Radio astronomy.

1427 - 1429 Point-to-point, mobile, space.

1429 - 1660.5 Various satellite transmission uses.

1660.5 - 1668.4 Radio astronomy.

1668.4 - 1700 Meteorological aids.

1700 - 1850 Meteorological satellites, U.S. Government.

1850 - 1990 Fixed point-to-point, microwave.

1990 - 2110 Broadcast studio-to-transmitter links.

(end)

maverick@csulb.edu (Hiran C. Fernando) asked:
> ... possible to restore the 0MHz-25MHz ... range on the RS Pro-2006.

You can only restore what was there to begin with. 800 MHz is designed in,
but was locked out for the US market. There's no circuitry for 0-25MHz or
520-760MHz, so there's nothing to restore.

Source record: 264944

maverick@csulb.edu (Hiran C. Fernando) asked:
> Does anyone know what traffic there is between 2000-3000 MHz?
> Is this what is called microwave?

Microwave is typically 50cm to 1mm, i.e. 600MHz to 300GHz. The FCC considers anything above 952 MHz as microwave.
The 2000-3000 MHz range is primarily point-to-point relay, auxiliary broadcasting, satellite communication, amateur, radio navigation & space research. Other than satellites, not much of interest. The FCC is selling off large chunks of the spectrum for new applications, so in a decade things may change.

6186. FCC License Data Sources

Newsgroup: rec.radio.scanner
Date: 1994-12-01 08:00:41 UTC
From: bill@thd.tv.tek.com
Message-ID: <3bjvr9$d65@news.tv.tek.com>
Source record: 264941
Cross-posted to: rec.radio.scanner,rec.radio.info

[last changed 06-Oct-94]

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner listeners. The FCC master contains a wealth of data about every non-government license in the United States. Most of the sources below contain a subset of this data, although a few contain all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing the data, you might want to consider forming a co-op of people in your area to share the cost. As far as I know, this is legal since the information is in the public domain. However, most software supplied to view or manipulate the data is copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $100, and the mapping version is $170 (shipping extra).

Floppies are available by state. The first state is $40, and each additional state is $30 (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells a variety of FCC data on CD-ROM and floppy. CD-ROMs are available by region or category, and floppies are available by state. Also available is a CD-ROM of the entire US (2.5 million records). Data is updated approximately every six months.

State floppies are $60 per state (add $5 for CA, FL, NY, TX, PA, OH, IL). Regional and full US CD-ROMs are $105 each. CD ROMs by category are $155 each. Quantity discounts available. PerCon can be reached at 716-386-6015.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service prints an 8.5" X 11" color map of an area with transmitter sites shown. Included are key sheets that list frequencies, callsigns, and licensee names. Ranges of 1/2 to 10 miles are available. The service is currently available for the following states: IL, IN, MI, MS, NY, OH, PA, WI. Additional states are being added. Contact Bob for more information. To print the map, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Maps are $20 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time. Bob asks that you do not send him e-mail regarding this service [probably because his e-mail account is supplied by his daytime employer].

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services at all frequencies. Data is updated approximately every six months (last update was Sep 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

|> radio links...

Here in the Dallas area the news sataions all monitor each others'
450MHz stuff and act on it. Every year WBAP does an April Fools stunt
which *never* fails to catch the other stations off guard. This year
they had Hillary Clinton arriving to throw out the first Rangers pitch
in place of George Bush Jr. They created a monumental helocopter
traffic jam with their reports of the motorcade carrying the First Lady
to __Whitewater Amusement Park__ for photos for her Christmas cards.
NAS Dallas was getting bombarded with requests to violate airspace so
the helos could catch up with the motorcade. I listened to the whole
thing on the 450MHz side and it was a complete hoot.

Well, there is such a thing as a sort of reciever that is called an
interceptor, its about the price of a good handheld scanner, but instead of the
user tuning the thing, it tunes itself to any nearby signal and then listens to
it. I cant remember the model name at this moment, but I will write again
with than info.

From: rsharp@paul.spu.edu
Message-ID: <3bl47g$jc4@adam.spu.edu>
Source record: 264955

I'm getting ready to make the big plunge. Have a Pro-2032, an ICOM R-1 and a Bearcat handheld (200 channel one, it's out in the car), and a Pro 2026.

I've been playing with scanners since I had to stick those silly little crystals in em to have a big five channels.

So my simple question <G> is...

For a desktop scanner, with the most features, best sensitivity, and either comes with no "gaps" or is modifiable, and is available either in the states or Canada... under $700,

WHAT IS THE BEST?

It seems that everyone keeps hooting about the AOR 8000. So far, this is the one I plan on buying.

Short replies please.

This sounds like a similar phenomenon I have come across with my two radios.

This happened last night:

The first radio, a Sony 2001D (2010 in US), tuned to 79.65Mhz FM, picked up BBC Radio 2, (which broadcasts in the 88-92Mhz range).

Next to this was a second radio, a Yupiteru MVT7000, also tuned to 79.65Mhz FM, but this was picking up 'Classic FM', which broadcasts at 101.1Mhz!

I have other similar instances to this.

What gives?

Andy, Manchester, The World!

I recently picked up a new PRO-2006. I am interested in the various methods people on the net program their scanners for flexibility and maximum coverage of important frequencies.

6216. Re: Railroad End of Train Xmitter Data Wanted!

Newsgroup: rec.radio.scanner
Date: 1994-12-02 03:28:19 UTC
From: jbrooker@garnet.msen.com
Message-ID: <3bm48jqoj1@garnet.msen.com>
Source record: 264973

I don't know about the data format, but the EOT freqs are usually 452.9375 and/or 457.9375.

I thought the purpose of the boxes was to permit the crew a way of knowing the train is still intact.

Useful to know since there's no cabooses anymore.

6217. Frequency database programs?

Newsgroup: rec.radio.scanner
Date: 1994-12-02 03:44:35 UTC
From: nldaniel@kong.syr.edu
Message-ID: <3bm573$rlt@newstand.syr.edu>
Source record: 264974

Are there any shareware/public domain programs that can be used to organize and keep track of scanner frequencies? I have heard that there are commercial ones, and I suppose that a spreadsheet could be used. I'm not looking to *control* the scanner, I have a 205xlt, I just want to keep track of frequencies. Any suggestions would be appreciated.

>Thank you.

>PS - Roosevelt Field is the largest mall on the east coast......

I believe that Roosevelt Field is managed by Pembrook Management. They are licensed for the following freqs. in Garden City (the 462.xxx are GMRS freqs.):

462.5625
462.5875
462.6125
462.6375
462.6625
462.675
462.6875
462.7125
462.725

464.375
464.925

Hope this helps you find what you're looking for.

6219. Which coax for discone?

Newsgroup: rec.radio.scanner
Date: 1994-12-02 05:40:49 UTC
From: maverick@csulb.edu
Message-ID: <3bmc11$c96@garuda.csulb.edu>
Source record: 264777

I am planning to put a Radio Shack discone antenna on my roof for my Pro-2006 scanner. For approximately a 50 foot run, which type of coax should I use, RG-8 or RG-8/M? I had read I should use 50 ohm coax, but I noticed that these two are 52 ohm. Will that damage my scanner?

The Radio Shack discone is $60, and I noticed that Icom sells a similar one for $100 and $120 with 80 feet of coax. Is the Icom superior to the RS for the difference in price, or are they relatively similar in performance.

Again, thank you very much for your help. I really appreciate it as a scanner novice. I try to read to learn as much as possible, so as not to disturb this group with basic questions, but sometimes I find limitations in my resources. You can email me directly if you'd like.

6220. Who Else Is Listening

From: matthews@resmel.bhp.com.au
Message-ID: <matthews.41.000C51E8@resmel.bhp.com.au>
Source record: 264967

Hi,

I have a IC-U16 hand held transceiver of which 15 channels have been pre-programmed. I would like to program the 16th channel to monitor the local emergency service channel, it's frequency is within the transceiver range. Do I have to send it back to the suppliers (ICOM) or can it be setup through the keyboard, there is nothing in the owner's manual about it.

Thanks,
Ian

> KKN377 Fire Dept Dallas" Anyone have any info on what freqs DFD is moving to?

Dallas has a block of TRS (Trunked Radio Systems) frequencies allocated.
I don't know what they are off hand, but they are listed in RS's Police
Call. I believe Dallas will use about 20 frequencies. The police
department will also eventually move to 800 MHz. The city is now divided
up into physical regions, assigned to specific frequencies. When the TRS
comes on line, the scanner listener will be forced to scan all 20
frequencies and listen to all traffic. The TRS unit in each city vehicle
will receive only the communications directed for it (i.e., units in the
Southwest part of the city will receive only SW dispatch). As far as the
city units are concerned, you'll still hear them say "Go to F1" or "Go to
F2", but all they are doing is telling the TRS controller to set them up a
virtual channel.

I believe there is alot of stuff on TRS in the FAQs, so I won't go into it
here. The main reason Dallas hasn't went to TRS (all the suburbs are on
TRS) is the cost. With thousands of radios out there, and TRS units
costing big $$$, it's unlikely that the police department will switch over
completely any time soon. The FD has less units, and that makes it more
practical for switchover.

At any rate, when most cities do switch, they usually simulcast on their
old frequency and the new 800 MHz frequency for quite some time, since the
transition period can take several months.

Hello,

Does anyone have any information on the PRO-43 from R.S. ?

I am comparing it to the AR1000XLT and the AR8000.

One feature that I would like is the ability to program multiple ranges of frequencies, in addition to channels. I would like to switch between scanning the 2 meter HAM to the 70CM HAM to the 800MHZ without having to reprogram each time. The PRO-43 can only store 1 limited range scan.

Drew.

Source record: 264783

I live near a Navy Lab and have been trying to find their security and operations/maintenance frequencies. The security is run by a private company and judging by the antenna on the vehicles, I would guess they operate in the 400 Mhz range. I have searched the business bands with no luck. There is no listing for the security company in the frequency guides that I have. I was wondering if the could be using a frequency in the govt. range (406-420)? The maintenance vehicles are Navy vehicles with US Govt plates. The antenna is a 30" base loaded whip. Any idea where to search for these?

Thanks in advance,

Jim

If you really want an effective 40-50 mHz Yagi just buy
an old 6 meter ham antenna. It is not quite resonant on
40-50 but since you are not going to transmit that has
little effect. If it were still legal to monitor cordless
phone this and a TV type rotor would be very effective particlarly
if the antenna was mounted vertically. 73 de Jerry

The price has been adjusted down to $265 or best offer. A ham adviced me that
these radios can be bought on sale for $349 in New York City Cammera shops.

He also advised me there is a source for the eproms that is only $2! per chip.
You can program as many chips as you want and several can be in the radio
for instant access at any one moment. IMHO that makes this fine radio any even better
value.

THE RADIO SHACK PRO-43 PORTABLE SCANNER

by Bob Parnass, AJ9S

The new Radio Shack PRO-43 is a small portable scanner made by General Research Electronics (GRE) which lists for about $350. Although it is a good step above other Radio Shack portable scanners, hobbyists awaiting a portable version of the famous PRO-2006 scanner will be somewhat disappointed.1 For instance, the PRO-43 is an "extended coverage" and not a continuous coverage scanner, covering these bands:

30 - 50 MHz (5 kHz steps), [30 - 88 MHz after modification]
118 - 136.975 MHz (25 kHz steps)
137 - 174 MHz (5 kHz steps)
220 - 225 MHz (5 kHz steps)

225.0125 - 512 MHz (12.5 kHz steps)

806 - 823.9375 MHz (12.5 kHz steps) [806 - 999.9875 MHz after modification]
851 - 868.9375 MHz (12.5 kHz steps)
896 - 999.9875 MHz (12.5 kHz steps)

Note the omission of the 10 meter ham band, the cellular phone band, the 75 MHz band, and the lack of coverage above 1000 MHz. Luckily, the September 1992 issue of Monitoring Times details a modification to restore cellular phone band coverage and expand VHF-low band coverage to 30 - 88 MHz.2

While the PRO-2006 has 400 channels, the PRO-43 has only 200 channels divided into 10 banks. Individual lockout and 2 second rescan delay may be selected for each of the memory channels. Users may select between AM and narrow band FM on any frequency. The PRO-2006 has 10 pairs of search limits

---

1. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

2. Speaking from experience, this modification is conceptually simple, but is quite a bit more difficult than restoring coverage in other scanners. It requires skill and good tools, including a tiny soldering iron. One must desolder a tiny surface mount diode and resolder it in a different place observing the proper polarity.

but the PRO-43 has only one pair and the step sizes are factory set. The PRO-2006 had selectable step sizes.

Both models have 10 "monitor" memories which can be written manually during a search.

The HyperscanTM feature means the PRO-43 is supposed to scan at 25 channels per second and search at 50 steps per second. The radio scans twice as fast, measured at 50 channels per second by the reviewer! When enabled, the priority channel is checked every 2 seconds. As in the PRO-2006, any channel may be designated as the priority channel.

Physical

The PRO-43 is just the right size for a portable scanner. It is smaller than the PRO-37 and Uniden 200XLT but larger than the tiny Icom R1.3 The gray plastic case feels about the same as a 200XLT, neither as rugged as the Icom IC-2GAT walkie talkie, nor as thin and chintzy as the PRO-37. Inside, there are 3 printed circuit boards and most of the components are of surface mount technology.

The top panel contains volume and squelch knobs, a 1/8" earphone jack, and a BNC antenna connector. A plastic belt clip of dubious strength is fastened to the rear with 2 screws.

A semirigid rubberized antenna is furnished with the PRO-43.

Performance Issues

The PRO-43 and Uniden 200XLT were tuned to the same frequencies both using their stock rubberized antennas.

On 857.4375 MHz, the PRO-43 heard Joliet Police signals full quieting which barely broke squelch on the 200XLT, due partly to the poor 800 MHz performance of the antenna supplied with the 200XLT. When the PRO-43 antenna was placed on the 200XLT, the 200XLT reception improved noticeably, but it was still not as good as the PRO-43.

---

3. See "Uniden/Bearcat 200XLT Scanner Review," by Bob Parnass, AJ9S, in the RCMA Journal, October 1988.

On 146.94, 162.475, and 460.1 MHz, the PRO-43 and the 200XLT were close in sensitivity.

When connected to an outdoor AV-801 antenna, paging interference rendered several VHF high band channels unusable. The problem disappeared when using the rubberized antenna supplied instead.

Owing to the use of up conversion, a high first intermediate frequency, images don't appear to be a problem as they were on other Radio Shack portable scanners like the PRO-34 and PRO-37. The PRO-43 IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

Somewhat "Mushy" Audio

The PRO-43 uses an LM-386 audio output IC and the radio is loud enough, but distorts severely when the volume control is advanced too far. This is partly due to the internal speaker as there is less distortion when using an external Motorola lapel speaker plugged into the earphone jack.

The PRO-43 audio lacks high frequency response. By comparison, the Uniden 200XLT has cleaner audio and more of it, especially when using the internal speaker.

Batteries

The PRO-43 requires 6 AA batteries, but none are included. A battery clip slides up into the bottom of the radio case and a separate trap door slides over it. Alkaline cells or NiCd cells will bring the scanner to life. Like most other Radio Shack portables, there are 2 jacks on the side, but they are smaller than usual. An optional, AC operated "wall wart" power supply/charger can power the radio or recharge NiCd batteries.

Current drain from batteries was measured at 88 ma. while scanning and 90 - 140 at various settings of the volume control with the squelch open. The PRO-43 averages 36% higher current drain than the 200XLT which means the batteries will need recharging more frequently.

Keyboard and Display

The user manual explains that the KEYLOCK slide switch "disables the keypad to prevent accidental program changes." In truth, most of the keys are disabled. The MANUAL and SCAN

keys remain enabled.

The liquid crystal display (LCD) is a smaller version of the display on the PRO-37. Being smaller, it is somewhat more difficult to read than the 200XLT display. Pushing the LIGHT button lights a single lamp behind the display. It stays lit for only as long as you keep the button pressed and is not latched or timed as in the 200XLT.

Summary

People who want a portable which covers both civilian and military aircraft frequencies should check out the PRO-43. The PRO-43 will be attractive to hobbyists who want more frequency coverage and fewer images in a smaller package than the PRO-37 or Uniden 200XLT and who don't want to fight the problems of using the more feature rich AOR 1000XLT.

x
IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

Dear nobody,

I don't have any experience with directional antennas with my scanner, but my experience with cordless phones and my scanner and I have found my range to be 3 or 4 blocks with the rubber ducky antenna, about 1/2 mile with a telescoping antenna, and around 1.5 miles when hooked to the old omni-directional ground plane that is 30 feet off the ground at my house. Usually the limiting factor isn't the distance, but the fact that it can be hard to find a channel, of the 10 in this range, that someone closer isn't using. I guess a directional antenna may be the ticket then. An interesting question. I'll read with interest any other replies you get.

I know Bob and take him and his magazine with ALOT of SALT.
He got mad with ACE communications who was a supplier of his aor radios
and the end result was that ACE refused to do any more business with him other then
a nominal advertizing presence of an old ad in his magazine.

How many other vendors of equipment has he alienated by his
business practices.

The only magazine that has lighter weight articles then Monitoring Times
is Popular Communciations. I get neither on a regular basis.

> This might be a bit esoteric or inappropriate, but I'll ask anyhow... does
> anyone here know the frequency and gorry details of the End of Train
> xmitters?...

They are a 457.937 Mhz. Almost all railroads except (I think) Norfolk
Southern use the same frequency. NS uses a frequency in the standard
161 MHz train frequencies. Each Fred has a "code number" on it that is
dialed into the receiver in the engine to make each engine pick up it's
own FRED transmissions.

It's a short "chirp" sound that occurs about every 30 seconds or so. Actually,
I think they send periodically or whenever the brake pressure changes or
the FRED starts moving.

The signal is weaker than you might think. You often have the head of
an approaching train in sight before you hear the FRED on a scanner.
Also, since the duty cycle is so low, you can't just put the frequency
in a scan channel and expect to catch it very often.

FRED's transmit brake pipe pressure and a signal when the train starts
moving. (I think) Most current FRED's are one way, but there is
talk about putting a two way link to allow the engine to tell the
FRED to dump air for emergencies. This may be already in place
on some railroads.

I don't know how the data is coded, but it does sound a bit like
1200 baud modem or packet radio signals.

The first letter indicates the month (1=january; 2=february...).
The letter 'A' indicates that the unit was imported through
Tandy's trading company 'A & A'. The final digit indicates the
year of manufacture (1=1991; 2=1992...note that 1 could also be
1981, 2:.1982...the last digit is reused every 10 years).

>transition period can take several months.

Close. Just not right.

So far it's only Dallas Fire Dept. 10 channels in an Ericsson-GE trunked
system with two additional simplex channels. All between 866 and 869 MHz.

Dec 1 at 1800 (maybe 1900) hrs started a 30 day acceptance test. If it
fails, they start over. The system uses six transmit sites transmitting
simultaneously. Since multiple transmitters interfere with each other,
it sounds real crappy. There is a control channel like Motorola systems
but it can be any of the ten channels.

The logical 'talk groups' include one for each of the batallion chiefs
so a structure fire will be worked on the group for the first chief

assigned. The other equipment and every firefighter will go to a channel
which gets re-grouped over-the-air to the chief's channel.

For now, VHF channels are paralleled onto 800 MHz channels.

A communications-disaster waiting to happen.

>noticed that these two are 52 ohm. Will that damage my scanner?

Nope. The ohms stuff is only critical for transmitting. 75 ohm coax
will work fine too. In fact, 75 ohm will do for transmitting too as
long as you aren't running a lot of power and you have a fairly modern
rig....but that's another topic. Since you have a 50 foot run of it,
get something "low loss" since you'll be attenuating UHF frequencies a
bit with a 50 foot run. With 50 feet, RG8 will do but RG58 might not.

>The Radio Shack discone is $60, and I noticed that Icom sells a similar
>one for $100 and $120 with 80 feet of coax. Is the Icom superior to the RS
>for the difference in price, or are they relatively similar in performance.

Get one with the vertical whip if you want good results on freqs below
100 MHz. Otherwise, the Rat Shack antenna will do fine above 100 MHz.

>disturb this group with basic questions, but sometimes I find limitations

I'd like to sell my AOR 1000XLT hand-held scanner:
--500KHz to 1300 MHz. (no gaps).
--1000 channel memory
--Scans and searches at 20 ch/sec
--10 scan banks; 10 search banks
--AM/FM/WFM
-- Increments of 5 to 995 KHZ
Unit comes with all accessories
(case, strap, earphone, 4 AA nicads, AC adapter, rubber duck
antenna and AOR's cheesy instruction book). Also
included is "Guide to AR1000," a whip antenna and cassette-car
adapter to playback scanner thru autosound tape system.
Paid $460 plus shipping for all in July. Sell for☐ $370 plus
shipping.

Also for sale: Optotronics 3300 frequency counter.
Built-in rechargeable batt; covers to 2.8 GHz;
fast/slow gate times; telescope whip; hold
button. Paid. $140 plus shipping in June. Sell for
$95 plus shipping.

Both in pristine condition. Haven't used either as
much as I thought I would. Reply by e-mail if seriously
interested. Thanks.

Date: 1994-12-02 21:44:00 UTC
From: sjp117@psu.edu
Message-ID: <sjp117.5.2EDF951F@psu.edu>
Source record: 264807

I have recently purchased the PERCON FCC database. I am generally very pleased with it. I am just having trouble with understanding the section that reads "special conditions" in the licenses.

These "special conditions" often read something like ex. #18 154.890

Does anyone know what these number codes mean? I have seen them go as high as the 70's.

Also I have noticed that some frequencies show an OPERATIONAL VICINTY that says something like "70 MIRA Houston", even though it might be a Pennsylvania license. Could a Pennsylvania station possibly interfere with a Houston station? Even in the 155.xxx range?

Thank you,
Steve

>CTCSS?
>
>Thanks alot people...

CTCSS is a subaudible tone transmitted along with the voice traffic. It stands for Continous Tone Carrier Squelch System. In places where many agencies and business use the same frequencies, CTCSS is used to control access to repeaters and lock out outsiders. By decoding the CTCSS tones, you decide who you will listen to on a multi-agency frequency.

6261. Uniden 900mz Phone

Newsgroup: rec.radio.scanner
Date: 1994-12-02 22:16:52 UTC
From: jlager@w8hd.org
Message-ID: <3bo6ck$8hj@tango.w8hd.org>
Source record: 264810

For those of you who own a Uniden 9100 or 9200 cordless 900mz phone and want more range, here is a way to increase it that has worked for me.

Buy a Radio Shack #270-1412 "replacement telescoping antenna" for $3.49 Remove the bottom section (screw) and substitute the remaining section for the factory base antenna. Fully extended, the new antenna is about 3X longer. Connection is mechanically identical to original antenna.

Other methods that involve coax or longer wavelengths can detune the multiplexer, but this mod works very well. And of course, get the base unit as high as possible.

BTW, if you normally experience a "hum" in the audio, be sure the base is not sitting on a metal surface.

Enjoy-
Jim Lagerkvist
jlager@w8hd.org

P.S. - If you have any comments to share about this phone, please email me. Exploring this product has become a hobby with me.

> 868 range. I'm not sure if it's real or an image. In any case, 868-894 is
> supposedly "common carrier" cellular phones. 894-896 I believe is airphone.

869-894 is base to mobile or fvc(Forward voice channel)
824-849 is mobile to base or rvc(Reverse voice channel)

859-865 range is used for commercial (not consumer) cellular traffic by
Nextel Corp.

894 -896 is used for commercial airlines

Here is the instruction package straight from Buffalo.edu:

This modification is courtesy of Monitoring Times magazine and the Grove Enterprises BBS - Brasstown, NC. 704-837-9200/704-837-5957/704-837-7081 (High Speed Modem).

Realisticr PRO-39 Cellular Restoration Instructions By Larry Wiland

NOTE: It is unlawful to monitor mobile telephone conversations, including cellular. Although the procedure described below will restore the missing cellular frequencies to your radio, it is possible to hear this range without any modification whatsoever by tuning in the image frequencies 21.6 MHz higher than the deleted ranges. Cellular calls will be heard from 894.01- 915.6 MHz on your scanner without restoration.

Grove Enterprises assumes no responsibility for damages or other liability resulting from attempting to duplicate this procedure. It is possible that this modification may void your warranty.

TOOLS NEEDED: Fine-tipped soldering iron, desoldering wick, small Philips screwdriver, long-nosed pliers, rosin core solder.

(1) Remove the battery door, holder and batteries from the bottom of the radio.

(2) Remove the 4 screws from the back of the scanner and carefully lift the back off.

(3) Unplug the two wiring harnesses at their connectors and remove the six bright colored screws holding the circuit board in place. Unsolder the ground wire from the lower right corner of the circuit board. Unsolder the two wire connections from the BNC antenna connector at the board. Carefully lift the board (grasping it near the Molex connector) and set it aside.

(4) Remove the two bright colored screws from the next circuit board. Carefully uplug the two-wire connector. Unsolder and lift the

rectangular metal shield exposing the diodes.

(5) Carefully unsolder and remove diode D6 only; this will restore the missing cellular frequencies which can be searched in appropriate 30 kHz steps.

This completes the cellular restoration. Reverse all procedures to reassemble the radio and test it by entering any frequency between 869-894 MHz. Curious about the other diodes? D4 would enable 68-88 MHz coverage, but deletes 30-54 MHz; D5 (present) allows 800 MHz band operation; and D7 would make cellular spacing 12.5 kHz (incorrect).

It's really whatever you like. Mine, I've got a channel bank with
law enforcement, one for fire, a couple for aircraft, cb frequencies,
one with TV and FM radio audio, some radiotelephone, military, and
commercial services, and even a group of frequencies that just let
me search up and down from certain points.
It really just depends, what interests you, what's in your area that
you can listen to, and the channel capacity of your scanner.

I am employed ay a railroad and have worked as part of a train crew
(brakeman, conductor, and student engineer). The EOT device comes in two
flavors- a 'smart' EOT (end-of-train) device and a 'dumb' EOT.
The dumb EOT is just a device that functions as a marker (red flashing
ight required 1/2 hr before sunset to 1/2 hr after sunrise- the dumb EOT
turns on and off the marker light by means of a photoelectric cell).
The 'smart' EOT sends the following data to the locomotive:
1) rear of train brake pipe pressure (must be at least 60 psi to be legal)
2) tells when rear of train is moving, so engineer knows that the slack
is stretched (there is a mercury switch inside the EOT that performs this)
3) tells if front to rear communication is lost
4) alerts engineer when batteries are low in the EOT
5) on some 'smart' EOT's, there is a feature whereby the engineer can
initiate a dump of the air in the brake pipe from the rear. The EOT
exhausts brake pipe pressure when the engineer throws a switch on the
companion EOT device in the locomotive (the in-cab unit is commonly
referred to as a 'wilma' and the rear device is often called a 'fred'.
Most EOT devices send a signal back to the front unit approx every 45
seconds.

matthews@resmel.bhp.com.au (Ian Matthews) writes:

I have a IC-U16 hand held transceiver of which 15 channels have been
pre-programmed. I would like to program the 16th channel to monitor the
local
emergency service channel, it's frequency is within the transceiver range.
Do
I have to send it back to the suppliers (ICOM) or can it be setup through
the
keyboard, there is nothing in the owner's manual about it.

RESPONSE:

In addition to the keyboard commands, there also is a clip inside the
radio that needs to be removed. I'm not sure I can describe it via here
where you need to look to remove it. Costs too much to stay online! As
to keyboarding, you need to program in the frequency, offset, xmit CTCSS,
receive CTCSS, channel, etc. Again, too detailed for here! I clone all
my U16's; makes it easier.

MRBECKZ1@ulkyvm.louisville.edu asked:
> I am picking up alot of bleed through of other frequencies with a
> Pro-43 in the aviation band, particularly in the 126-134 Mhz range.

The problem you're encountering is 'intermod' (intermodulation), where several strong local signals mix in the receiver and produce interference. The signals you're hearing are most likely from the 152 MHz common carrier band (pagers and conventional mobile telephones).
The Pro-43's triple conversion is not much help, as the signals are entering through the case and mixing in the 3rd I.F. This has been noted in the 160 MHz railroad band by a number of Pro-43 users. What is unusual is that you're hearing these FM mix products when using the AM detector.
I suspect you're quite close to an older paging/phone tower.

Yes Bill, this is true. However, since this person stated that they are a
rookie, it would be kind of you to also inform them that they would need
to obtain a special license to use such a phone patch.

We don't want people to think that there are no strings attached now do
we? :) So not to scare the person away from purchasing a ham radio, I
will say that the licensing examination is fairly simple.

6284. PRO-43 V.S. AOR AR1000 vs AR8000

Newsgroup: rec.radio.scanner
Date: 1994-12-03 10:16:41 UTC
From: Flying Turtle <vhealey@crl.com>
Message-ID: <3bpgi9$rac@nntp.crl.com>
Source record: 264841

If you want to follow a TRS the PRO 43 is better then an AOR 1000.
The over all quality of construction is somewhat better in the PRO 43.

The AR 1000 is a neat radio and has a few strong points.
Once you understand how it is programed and why the folks designed it that way
you can do incredible things.Briefy you have 10 independent search banks that can be linked together
in a search. I someetimes programed the it to look at vhf fire, vhf police 154-156 area
,vhf police 158-159, uhf police 453 and uhf police 460 -460.6 in five consecutive search banks.
I locked out the other five banks. Then by hitting search I could quickly find
and follow activity in a new area as I traveled. Often the uhf ranges
were of no use and I could go with my favorite vhf band. You could lock
out anoying birdies, and other frequencies. There were 100 lockouts in each
search bank and you could review them.I regret selling my ar1000 several
years ago because i got alot of use out of that versatile little radio.
Many others who bought it hated it. Difficult to program, and poor quality control.

Actually it wan't all that difficult to program IMHO but the instructions
sucked.I spent a couple of days rewriting the manual in Vic Healey english
as I tried various key presses. That is why I grew to like it as some of the options
began to make sense. Even the strange ripple case was an intelligent choice
when you had wet hands and realize these little radio bricks can
squesses out of your paw like a slick block of soap.

When I was fishing in the Gulf the little metal ears made sense wehn
I realized I could firmly attach a strap to the radio and to myself
to keep it from swiming in the gulf when I was only wearing swim trunks.

The pro 43 is made to be lost with the little PLASTIC belt clip which
constantly breaks. What a cheap cludge!

The ar8000 is supposed to be the ultimate handheld reciever and I just bought
one. I will let you know how I feel about it later. I am selling my 43, complete
with knicks from hitting the ground every time that stupid clip broke.
I have a gentleman who offered me $250 locally for it and I hope he
comes up with the cash Tuesday.

Oh by the way I hated the audio from the 43. Even installing the new type
speaker failed to really improve it. It may bother you somewhat also.

I have met a few of you via email and posts and based on
your enthusiam for the ar8000 I decided to go ahead and
buy one.

I hope to have a www site at ping.com for distribution of information
regarding the ar8000. If anyone has a page scanner an can scan in
and recognize the text from the ar8000 manuals and the computer interface
manual I would appreciate hearing from you. This information can
be the bases of helping others understand how to extend the programing
capabilites of the ar8000.

For those that don't think it is worth the effort or cost to buy
or build a computer interface to the ar8000 I will offer to
program it for you with your data whcih you can upload via ftp to my
computer by pre arrangement. You pay for fedex both ways and send a nominal
$15 to cover my time and expense of dealing with ups or fedex as well
as the time to actually program and then check your ar8000. My time
is actually worth quite a bit more then that but this is a hobby.
Specifications as to data format are forthcoming as soon as I figure them out.

To get on a list of folks interested in the ar8000 emaito:vic@ping.com
with ar8000 as the first word in your message header. This is not a lsitserv
but myself storing your replies in eudora mailbox. I don't really expect to hear from
but a few folks as the ar8000 is a rare radio in the US and rather expensive
so it isn't worth the effort to get too fancy. Please note in your message if you
have one or have ordered one or just merely interested in information about them.

>Just more of the same?

In the pro39 and the pro34 you can get some cellular images up there that are quite clear BEFORE you do the mod. After the mod these cellular images are gone. Don't own any other models so can't comment on them.

After the mod 869-894 is unlocked and the freqs there are in the proper 30 kHz steps. Not 12.5 like the other 800 areas. Do the mod cuz you will hear many, many more calls that those images give. During weekdays around 5 when folks are getting off work you can literally hear upwards of 100 calls in the 869-894 area. At least in this mid-size city.

6288. Inmarsat Satellites

Good hand-held continues coverage scanners costs approx. $650+ USD and by the
way are not available in USA. (They are but with a freq. gaps).
Can frequency counter be used for detecting of radio transmission?
Another suggestion: Because entry into your apt. is not easy (for whoever)
on regular basis - any radio transmitting equipment most likely was
installed close to power source (to provide permanent power supply).
So look for power outlets or close by places.
If you'll got scanner - I've read somewhere, that small transmitters could
use: 30-200MHZ range. This of course is not the rule - just a point to
start.

6291. Re: Which coax for discone?

Newsgroup: rec.radio.scanner
Date: 1994-12-03 16:40:37 UTC
From: Anthony LaBella <72737.2400@CompuServe.COM>
Message-ID: <3bq725$hf2$1@mhadf.production.compuserve.com>
Source record: 264846

Neither will physically damage your radio, but the thicker cable has
lower line losses and you will lose less signal in the cable. Both are
amout 50 ohms characteristic impedance and will match the discone.
Buy the cheaper antenna. All discones are about the same, no matter
whose label is on it.

6292. Re: R.S. scanner date codes?

Newsgroup: rec.radio.scanner
Date: 1994-12-03 17:03:47 UTC
From: adamld@atl.com
Message-ID: <1994Dec3.170347.29622@atl.com>
Source record: 264850

As I recall, the first digit is the year of manufacture (1991 and
1995 respectively for your two devices). The middle letter is
either "A" or "B" for "after" or "before", which relates to the
last number, which is the month of either manufacture or the
"freshness date" in the case of batteries.

I'm thinking of getting a handheld scanner. The cellular mods sound like fun. I'm willing to spend $200-300.

I saw a year-old Pro-2022 (w/mods) for sale for $200. Is that a good price, and a good scanner? Should I just buy one of the newer models shown in the Radio Shack catalog instead, and do the mods myself? Are there other trade-offs involved?

6295. Re: OptoScan 456 Info

Newsgroup: rec.radio.scanner
Date: 1994-12-03 19:07:38 UTC
From: VPFS89A@prodigy.com
Message-ID: <3bqflq$q72@usenetw1.news.prodigy.com>
Source record: 264860

I have an Opto 456 and run it with an ancient Toshiba T-1000 using
ScanStar. Basic version, not the Pro version. I usually run it while
I'm working on my desktop, and since my desktop machine didn't have any
more Rs-232 ports I drug the T-1000 out of the closet, dusted it off, and
got the nicads going again, and it works perfectly. Also it can go along
if I decide to try to run the Pro-2006 from my car.
The only problem I had was installing a little clip onto one of the IC's
in the Pro-2006, the clip was very long and when I tried to put the lid
on. Trying to solder this lead without the clip caused other problems.
But, in fairness, other people have got the thing together and managed to
bend this clip down without it hopping off.
But to answer your question, ScanStar standard version should run on
about anything you have with a spare 232 port.

Enjoy --->Richard

6296. Philly POLICE 911 call transcripts

Newsgroup: rec.radio.scanner
Date: 1994-12-03 19:15:04 UTC
From: scan911@aol.com
Message-ID: <3bqg3o$38b@newsbf01.news.aol.com>
Source record: 264852

Here's a transcript of the now-famous Philadelphia Police 911 calls in
which dispatchers were cited as rude. The rudeness is at 10:44:23.
Enjoy!

Chuck Gysi, N2DUP
SCAN911@aol.com

10:01:25 p.m.
dispatcher: Police 225.
Caller: Hi. I'm sorry to call you, but could you please send a car to the
McDonald's at the corner of Hasbrook and Oxford?
Dispatcher: On the corner of Hasbrook and where?
Caller: Oxford. It's in Fox Chase.
There are a pack of kids and they're really noisy.
Dispatcher: Inside the McDonald's?
Caller: They're in the parking lot.
Dispatcher: OK, the McDonald's parking lot.
Caller: Thanks so much.
Dispatcher: You're welcome. Bye.

10:10:19 p.m.
dispatcher: Police radio [inaudible.
Caller:: Ah yes, I'm calling from the McDonald's at Fox Chase on Oxford
Avenue.
Dispatcher: Uh-huh.
Caller: I have a bunch of kids in the parking lot and they just broke one
of
my customers' windows.
Dispatcher: Where's the customer?
Caller: She's out in the parking lot and she was going through the
drive-through and they broke one of her
windows.
Dispatcher: Is she going to wait for the police?
Caller: I'm sorry.
Dispatcher: Is she going to wait for the police?
Caller: Well, how long is it going to be?
Dispatcher: I have no idea.
Caller: Uhhh, I'll find out, but I imagine she would. She could fill out a
report. OK.
Dispatcher: Uh-huh.
Caller: OK. Thank you.

10:13:58 p.m.
Dispatcher: Police radio. May I help you?

Montgomery County dispatcher: Hi, it's Montgomery County. We have a report of a disturbance at Borbeck and
Oxford.
Dispatcher: OK. On the highway?
Montco dispatcher: On Borbeck.
Dispatcher: On the street or inside somewhere ?
Monaco dispatcher: Juveniles throwing rocks -- at the McDonald's.
Dispatcher: At the McDonald's?
Monaco dispatcher: Yeah, there's about 20 of them.
Dispatcher: All right, we'll send somebody out there.

10:20:49 p.m.
Caller: Could you send some police over here to 7979 Rockwell Avenue? About
50 kids are busting up cars [Inaudible]
Dispatcher: What are they doing?
Caller: Busting up the cars, windows and everything . . . 7979 Rockwell Avenue.
Dispatcher: Uh-huh. Wait a minute.
They are inside the lot?
Caller: Yeah.
Dispatcher: Teenagers?
Caller: Yep.
Dispatcher: About how many is
there?
Caller: About 50.
Dispatcher: All righty.

10:33:58 p.m.
Dispatcher: Police 232.
Caller: Hi, this is the Oxford Avenue Pizza Hut. We have a gang of at least
50 young kids with bats outside beating each other, chasing each other. They
Just ran behind the store.
Dispatcher: How many have bats?
Caller: About 10.
Dispatcher: What hundred Oxford is?
Caller: What hundred Oxford is this? 78. They are between our store and the
McDonald's.
Dispatcher: In the parking lot?
Caller: Yep. Yes, in between both parking lots.
Dispatcher: OK.
Caller: Thank you.
Dispatcher: You're welcome.

10:37:15 p.m.
Dispatcher: Police 225.
Caller: I don't believe this-- this rang about 10 times. There's a big commotion going on outside our home. Like a gang fight.

Dispatcher: Where is that, ma'am?
Caller: Ridgeway Street. 7900 Ridgeway Street.
Dispatcher: OK.Caller: They got clubs out there. [It's a gang fight, says a
male voice in the background.] There's a kid hurt out there.
Dispatcher: All right.
Caller: Did you get that?
Dispatcher: Yeah, a kid is hurt outside and there's a fight. All right? Was
that it?
Caller: Yeah, that's it. Send a police car to Seven
Dispatcher: Wait a minute. Wait a minute. Wait a minute. You asked me and
I'm asking you. I have the infor-
mation, you can hang up now.

10:37:34 p.m.
Dispatcher: Police 244.
Caller: Thank you. I'm calling from the Fox Chase section of the city. There
seems to be a lot of gang fighting in front of my house. 7900 block of
Ridgeway Street. It's just above the recreation center. A lot of screaming,
yelling, and kids look like they are carrying clubs of some kind. They are
in the middle of the street.
Dispatcher: I'll send someone out.
Caller: Thank you.

10:37:50 p.m.
Dispatcher: Police 45. How can I help you ?
Caller: Hi, I live across the street from the Fox Chase School and the
playground and there is a tremendous amount of kids out there fighting and
... I'm afraid something's going to happen.
Dispatcher: OK, Fox Chase playground. What's the address?
Caller: Uh, it's, well, right now they're in front of Ridgeway and Rhawn in
front of the school but they just keep growing and they keep talking about a
fight ...
Dispatcher: OK. Ridgeway and what's the other street you mentioned madam ?
Caller: Rhawn.Dispatcher: Oh, OK. We'll send somebody out.Caller: Hurry up
because I don't know what's happening, there's a lot of screaming and
yelling.
Dispatcher: Yeah, OK. Bye-bye.

10:38:25 p.m.
Dispatcher: Police 170.
Caller: Hi, I'd like to report a disturbance . . .
Dispatcher: Where?
Caller: Ridgeway Street.
Dispatcher: What and Ridgeway?
Caller: 7940 Ridgeway Street. There's about 20 kids outside fighting.

Dispatcher: We'll send somebody around.
Caller: Thanks a lot.

10:41:01 p.m..
Dispatcher: Police radio.
Caller: Yeah. Could you get a couple of cars over here, 7979 Rockwell Avenue. There's about 50 teenagers, baseball bats. A gang fight down in the
complex between the Fox Chase playground and the auto body area.
Dispatcher: 7979 Rockwell?
Caller: Yeah.
Dispatcher: We'll get somebody right over.

10:41:21 p.m.
Dispatcher [alerting police officers]: 203 . . . 7845 Oxford at the Pizza Hut/McDonald's parking lot. Check for
civil males all with baseball bats. 7845 Oxford. Parking lot McDonald's and
Pizza Hut. There's no flash.
Police: 28.
Dispatcher: 28.Police: We'll swing by that location.

10:41:24 p.m.
Dispatcher: Police 157. What's your problem ?
Caller: Yeah, I just want to let you know. I live across from the Fox Chase
playground.
Dispatcher: Yeah.
Caller: And there's about 25 youths right now running around, yelling obscenities, yelling about niggers and everything else. They are running through people's yards and all. I don't know if something's going on tonight
or not, but ...Dispatcher: Somebody will be there, sir.
Caller: Thank you.

10:42:32 p.m.
Dispatcher: Police 170.
Caller: Hi, how ya doing. This is . . . I'm in Fox Chase and we've got a near riot and there's no damn police around.
Dispatcher: Where? Where?
Caller: On Ridgeway Street!
Dispatcher: Well, I don't know that!
Caller: We've been calling. Everybody in the neighborhood's been calling. I
call the district, they tell me to call 911. What are we suppose to do here?
There's cars. There's a whole damn convoy of cars coming up here. You got a
damn riot goin' up here.
Dispatcher: Police will be there.
Caller: Yeah, huh. Thanks a lot

10:44:13 p.m.
Dispatcher: Police 244
Caller: Yes. This is one of the sisters at St. Cecilia's Convent on Rhawn Street. There's a bunch of kids out in the parking lot and it looks like they are beating up one kid.
Dispatcher: 500 Rhawn, madam?
Caller: 525 Rhawn.
Dispatcher: In the parking lot?
Dispatcher: We'll send someone out.
Caller: Thank you.

10:44:23 p.m.
Dispatcher: Police 94Caller: We're in Fox Chase on Ridge way Street. They are beating the hell out of people with baseball bats up here. When are you
going to send somebody?
Dispatcher: Who's got a bat, sir?
Caller: Who got a bat? Some gorilla. What the hell do you mean?
Dispatcher: Wait a minute! Wait a minute! Don't talk to me like that. I asked you a question.
Dispatcher: Who's got the bat? Is he white, black or Hispanic?
Caller: There's a man with a bat ...
Tape ends.

10:44:37 p.m.
Dispatcher: Police 232.
Caller: Hello?
Dispatcher: Police.
Caller: [inaudible].
Dispatcher: Where?
Dispatcher: This is at Rhawn and what?
Caller: At Rhawn Street. St Cecilia
Dispatcher: OK, but that's Rhawn and what. What's the cross or what hundred
block of Rhawn.
Caller: It's St. Cecilia schoolyard. [Inaudible].
Dispatcher: Yeah, what hundred block of Rhawn Street is it on, sir/ I can't
hear you because there's something wrong with the phone. You're saying Rhawn, and it's by what?
Caller: I'm trying to find a cross street ..... What street is this [caller
speaks to someone in the background]?
Dispatcher: Look at one of the buildings and tell me the address on it
Caller: Yeah, it's on Rhawn and [inaudible].
Dispatcher: Rhawn and what? Look at one of the buildings and tell me the address on it.
Caller: 500 Rhawn Street
Dispatcher: 500?
Caller: Rhawn Street. A [inaudible] just went by.
Dispatcher: Where's he at? [Get an a dress, says another voice in radio room]

Dispatcher: OK.

10:45:37 p.m.
Dispatcher: Police 157.
Caller: Hello?
Dispatcher: Yes, police.
Caller: My friend, my friend's bleeding. He's at [inaudiblel hospital.
Dispatcher: He's what?
Caller: He's at [inaudiblel hospital.
Dispatcher: Slow down, he needs what at the hospital?
Caller: I mean. [inaudible] He needs a hospital. He's bleeding.
Dispatcher: Where's he at?
Caller: He's at St. C's. At the church.
Dispatcher: He's where?
Caller: St. Cecilia's.
Dispatcher: I can't understand you? Give me an address?
Caller: He's at St. Cecilia's.
Dispatcher: And where's that at?
Caller: Oxford Avenue.
Dispatcher: Oxford and what?
Caller: It's like. Oh my god.
Dispatcher: Listen, listen, if you don't calm down, he gets no help. Do
you
understand that much?
Caller: I'm trying.
Dispatcher: All right, so you gotta tell me. Oxford and where?
Caller: Oh God. Do you know where Fox Chase School is?
Dispatcher: No, I don't.
Caller: OK, it's, it's Oxford Avenue and Verree.
Dispatcher: Verree. All right, what happened to him?
Caller: He got beat with a bat.
Dispatcher: All right. Are the people that beat him still there?
Caller: No!
Dispatcher: Hold on. I'm Gonna connect you with rescue, you tell them
where
he is.
Caller: OK.
Rescue: Rescue.
Caller: [inaudible] got beat with a bat.
He's at [inaudiblel church.
Rescue: What?
Caller: St. Cecilia's.
Rescue: What's your address. What's the address. Where's it at?
Caller: It's right across the street from the [inaudiblel school, which is
right by ... Rhawn.
Rescue [to dispatcher]: Please, could you tell me where she's calling
from?
Dispatcher: She's calling from 501 Rhawn Street by the Free Library.
Caller: Yeah, I'm at the Free Library, but ... is at St. Cecilia's Church.
Dispatcher: She told me it was at Oxford and Verree, first. She can't seem

to get it together.
Rescue: Is that where St. Cecilia's is? Oxford and Verree?
Caller: It's, it's . . . Where are you at?
Dispatcher: Don't worry about where we're at. Tell them where you're at. Where you want him to go?
Caller: [Inaudible] I don't know the two streets. Right now, I'm at the library, but St. Cecilia's at ...
Rescue: How far are you away from it?
Caller: He's at, I think he's at Rhawn and [inaudible] Street.
Rescue: Rhawn and where?
Caller: I think it's [inaudible, but I'm not sure. It's at St. Cecilia's Church. He's right in front of the church.
Rescue: And what's wrong? What happened?
Caller: He got beat with a bat.
Rescue: He got beat with a bat?
Caller: He's bleeding.
Rescue: It's right near Rhawn and [inaudible.]
Dispatcher: No, no. It's not a good cross street. She's probably talking about Rhawn and Verree.
Caller: It's at St. Cecilia's Church. He's right at the church.
Dispatcher: Rhawn and Verree is close to where she's calling from.
Rescue: We're on the way.
Caller: Thank you.

10:45:53 p.m.
Police officer: 203.
Dispatcher: 203.
Police officer: Send rescue to the Seventh District side right at Rhawn and
Ridgeway in front of a church. We've got a kid down. I think he was beat up.
It could possibly have something to do with that Oxford Avenue thing.
Dispatcher: You said Rhawn and Ridgeway?
Police Officer: Correct. On the Seventh
District side. [inaudible] rescue, please.
Dispatcher: Thank you.

10:45:59 p.m.
Dispatcher: Police 170.
Caller: Hi, Could you send a car to Fox Chase Rec.
Dispatcher: Where's that?
Caller: Um. It's on, uh, Rockwell Avenue. There's a bunch of people in cars
and they are coming out and beating people up.
Dispatcher: OK.
Caller: It's really bad. Can you hurry?
Dispatcher: OK.

10:46:22 p.m.
Dispatcher: Police 344.
Caller: Hi. We're having a problem outside our house here.

Dispatcher: What's your address.
Caller: Ok. It's not on my street. It's at St. Cecilia's on Rhawn Street. In
the rectory. In the schoolyard.
Dispatcher: What's the address there?
Caller: OK. 525 Rhawn Street.
Dispatcher: 525 Rhawn?
Caller: Right.
Dispatcher: Is it R ...
Caller: R-H-A-W-N! We've got kids they've beat up. And no one wants to
help us!
Dispatcher: I'm trying to help you madam. I have to first understand you.
Caller: Rhawn. R as in robot. H as in
health. A as in apple. W as in linaudible] and N as in [inaudible]. Does
that help?
Dispatcher: Immensely. Now, can you continue? What's the problem there?
Caller: We've been calling for 20 minutes now to get the cops up here and
no
one's come.
Dispatcher: So, what, what's, what madam. Madam?
Caller: I'm near the Fox Chase Rec
Dispatcher: Madam, what's going on out there?
Caller: I've been telling you ...
Dispatcher: You haven't told me what's going on?
Caller: We have like a group of 50 kids out front, about.
Dispatcher: Uh-huh. What are the kids doing, madam?
Caller: Well, a few of them have golf clubs. And then this one little boy
just came down and said to us someone's
beating him up with a baseball bat.
Dispatcher: We'll send the police, madam.
Caller: Pardon me.
Dispatcher: We will send the police.
Caller: Send them now, not in 10 minutes, but now.
Dispatcher: We will send the police, madam.
Caller: Thank you. Do you know where it is?
Dispatcher: You said 525 Rhawn
madam. That's what you said, didn't you?
Caller: Yes.
Dispatcher: OK, that's where we're gonna send them.
Caller: Thank you.
Dispatcher: You're welcome.

10:46:32 p.m.
Police: Have a rescue [inaudible] in and out of consciousness.
Dispatcher: All right, 03. Rescue's in route. They got the message.

>involved it would be neat to see what lawyers for the Americans With
>Disabilities Act could do with them. The fines are tremendous for even
>today's lifestyles and it takes so very little to be found guilty......

Supposing there is a disability which caused a person to mis-type a word
(hard to immagine, since he articulated the entire message just fine
except for that word), and other people posted follow up messages either
A. Correcting his mistake (as I did)
or
B. Making fun of, in some way, his mistake (as many did)

There is no form of retribution of the person with the "disability" twards
those who posted followups. If the person claimed that the followups
contributed to mental distress, or other emotional trauma, he would
be able to file a civil suit, but proving that postings on the Internet
contributed to mental distress and anguish would be very hard to do, and
quite humerous.

Otherwise, it's a freedom of speech issue.

>noticed that these two are 52 ohm. Will that damage my scanner?
>
>The Radio Shack discone is $60, and I noticed that Icom sells a similar
>one for $100 and $120 with 80 feet of coax. Is the Icom superior to the RS
>for the difference in price, or are they relatively similar in performance.

I am running RG-6U on my RS Discone. You can also run Belden 9913 if you
are feeling rich! I don't worry too much about line impedence on feed-line
as it really doesn't present a problem with recievers. It has 100% shielding
and very, very low loss (esp compared to RG-58 that Shack will try to sell)
RG-8U (foam dielectric) is what I would choose if you are stuck with RG-8

cheers

From: "Brian Heath"
Message-ID: <3bqine$8ao@uhost1.servtech.com>
Source record: 264854

Does anyone know whether Monroe County is moving its public safety radio frequencies to 800 MHz?

I saw them building a new radio tower at its communications center and I'm seeing antennas that look like 800MHz on the Rochester police cars?

If anyone knows -- any idea on frequencies?

Thanks,

Brian

>a good price, and a good scanner? ...

Strong images from cellular phone conversations make it difficult
to monitor public safety and business traffic in the 851-869 MHz
range on my PRO-2022.

RadioMap(TM) shows the nearest cell site to be several miles away
from my home.

Pay a few bucks more and look for a used PRO-2005 or PRO-2006
instead -- unless you are interested only in the 869-894 MHz
band.

In a thread, miles back, I asked about Hooper swan tracking, if anyone knew the frequencies.
Then, I noticed after some time in the rec.radio.info group a news item with that title, but I couldn't get it, since I saw it as a header, only.
When I went to fetch it, it had already gone off the machine.
Anyone manage to get it? or at least, know the frequencies used?
Thanks

No, because you're not transmitting (ignoring the IF bleed from the
tape-out phono). What is more important is that you won't even
notice any appreciable difference in Rx S-level, because 50 Ohms is
a nominal value only, and 4% is an acceptable tolerance. In fact by
the time it's been nailed to the wall, folded back upon itself
etc., thus altering its actual impedance further, in most cases
it'll still perform adequately.

Toodle pip!

: Poking fun is one thing, but your post didnt look humorous to me. I saw
: no "grin" or ":)" or anything or even any phrase that was remotely
: funny. I just saw a person so bored he had to flame a guy for
: misspelling a word, instead of simply correcting him.

I don't believe in using "smileys" to indicate humor or other emotions.

I suppose you never heard of "irony". You might look it up in a dictionary,
it has nothing to do with iron vitamins.

If I must explain: It is ironic that a person has a rig for sale, which
he/she has presumably been using for some time - and probably even has
handy to examine - and yet misspells the name. To me, this is a large
incongruity between the actual and normally expected results.

Continuous Tone Coded Squelch System...

SUBAUDIBLE tone is transmitted along with the carrier.

Those who DO NOT WANT to hear transmissions from units WITHOUT a
specific tone turn on their tone squelch (CTCSS). Then, they will
hear ONLY those transmissions that are accompanied by the tone. Note
that this acts only as a filter for the listener. If you don't have
CTCSS in your receiver you will hear EVERYTHING on the channel.

Anyone got the freqs for the West Orange, NJ PD? They just recently moved to 800mhz someplace within the last 6 months.

6320. Berkeley, Cal. Freqs?

Anyone with main Fire & Law enforcement frequencies for this area?

Thanks.....
.....Joe
